## PRINCIPAL RIVERS OF THE U. S.

TOTAL number of navigable streams in United States, 295, tributary as follows, the total navigable length in miles being in parentheses—Atlantic, 148 (5,365); Gulf, not including the Mississippi, 53 (5,212); Mississippi and branches, 54 (13,912); Canada, 2 (315); Pacific, 38 (1,606). Total navigable length, 26,410 miles.

The Hudson was one of the earliest rivers of the country to be improved by the Government. Work began even before 1822 by the State of New York, at which time the Erie Canal was opened, and in 1823 the Erie and Champlain both emptied into the pool created by the State dam at Troy, finished about that year. Work by the United States began in 1834.

## THE PANAMA CANAL.

(Opened for Navigation August 15, 1914. Gov., Col. Jay J. Morrow, U. S. Army. Balboa Heights.)

THE Panama Canal was built between latitudes 8 and 9 N. across the Isthmus of Panama at its narrowest part but one. The saddle through which it crosses the continental divide was originally about 335 feet above sea level. Gold Hill, the highest point immediately alongside the channel of the Canal, rises 540 feet above sea level. The Canal has a length of 43.8 nautical miles from deep water in the Atlantic to deep water in the Pacific. The Canal extends at sea level from its starting point in Limon Bay to Gatun, 5.77 miles. At Gatun the sea level section ends in a flight of three pairs of locks, forming the steps to Gatun Lake, with its normal elevation 85 feet above the sea.

Gatun Lake was formed by damming the Chagres Valley, and excess water, wasted through the spillway, finds its way to sea through the old course of the Lower Chagres. The Canal proceeds up the valley of the Chagres 20.55 miles to Gamboa, and in this section relatively little excavation was required. At Gamboa begins the real drive through the divide, the famous Culebra Cut. It is 6.97 nautical miles long, 300 feet wide at bottom, and extends to Pedro Miguel lock and dam, on the Pacific slope of the divide. Here one lock lowers the ship to Miraflores Lake, a small body about a mile long, with its surface 55 feet above the sea. At the south end of this lake are Miraflores locks, which, in two steps, lower the ship to the Pacific. A sea level channel 7 miles long carried past Balboa and out into the Pacific.

The minimum depth of the channel is 41 feet, and in parts of Gatun Lake it is about 80 feet deep. The lock chambers have a clear width of 110 feet and length of 1,000 feet, giving ample handling room for the largest ships yet built. Gatun dam, by which Gatun Lake was formed, is a big, gently sloping mound, built by pumping sand and clay into the space between two ridges of rock and earth. It is 1½ miles long and ½ mile wide at its base. Its crest is 105 feet above sea level and the width of the dam at the top is 100 feet.

The Panama Railroad extends between Colon and Panama on the eastern side of the Canal.

The Canal Zone is the strip of land extending five miles on either side of the axis of the Canal, but not including the cities of Panama and Colon, which remain within the Republic of Panama. It has an area of 441½ square miles, including land and water. It was granted to the United States by the treaty made with Panama, February 26, 1904. The United States paid $10,000,000 for the Zone, and makes an annual payment in addition of $250,000.

### ORIGIN AND DESTINATION OF CARGO.

The tonnage of cargo passing through the Panama Canal during the fiscal year 1922 (10,884,910) was equivalent to 93.8 per cent. of the tonnage of the previous year (11,599,172).

The greatest shrinkage was in the trade with the west coast of South America. Exports from the Atlantic and Gulf ports of the United States to that region fell from 933,261 to 244,514 tons. European exports to South America declined only from 297,166 to 283,804 tons. Exports from South America through the Canal to the United States were 548,609 tons, as compared with 375,597 in 1921, and to Europe 663,127, as compared with 922,499. Combining imports and exports and Europe and the United States, this South American trade was less by 1,388,469 tons, and to this may be added a difference of 398,097 tons in crude oil shipments from Mexico to South America, or a total of 1,786,566.

The trade with Australasia has also fallen off. Exports from the United States to Australasia declined from 620,428 to 288,090, and exports from Europe from 391,848 to 359,895. Imports from Australasia to the United States fell from 147,877 to 45,957, and to Europe from 579,745 to 381,538. The total loss of cargo in the Australasian trade amounted to 664,418.

Exports from the United States to the Far East increased from 1,213,906 to 1,728,172 tons. Imports from the Far East fell from 428,044 to 303,315.

Welland Ship Canal is under construction, and is not yet open for traffic.

The Queenstown-Chippawa Power Canal of the Ontario Hydroelectric Commission, total cost about $80,000,000 (of which $15,000,000 is yet to be spent), was opened Dec. 28, 1921, at Niagara Falls, Ont. Construction was begun in 1917. About 275,000 horse-power is generated, which is to be increased ultimately to 550,000. The canal is 12¾ miles long.

### CATSKILL AND CROTON AQUEDUCTS.

Particulars of the Catskill and Croton Aqueducts, which supply the City of New York with water, are contained in the article on the water supply of that municipality, elsewhere in the ALMANAC.

## FAST OCEAN AND AIR PASSAGES.

*Sailing Ships*—Columbus, in 1492, sailed from Spain (Palos) to the Gulf of Mexico in thirty-seven days.

The American-built clipper, the Lightning, of the Black Ball (British) Australian Line, on March 1, 1854, sailed 436 nautical miles, on way from Boston to Liverpool, on her maiden voyage. A gale was blowing and the ship's log showed a speed as high as 18½ miles an hour. The same vessel, on March 19, 1857, sailed 430 nautical miles, on way from Liverpool to Melbourne, Australia. The clipper Donald McKay, Black Ball Line, on Feb. 27, 1855, sailed 421 nautical miles on maiden voyage from Boston to Liverpool.

The fastest day's record on a sailing ship on any sea—437 miles—was made by the Sovereign of the Seas, on a passage from New York to San Francisco. The Flying Cloud made 433½ miles in one day, New York to San Francisco.

The quickest passage of a clipper ship across the Atlantic was made, it is asserted in maritime circles, by the Dreadnaught, which cleared from New York on June 15, 1859, and arrived off Cape Clear, Ireland, on June 27—12 days. The clipper Red Jacket, built at Rockland, Me., sailed from Sandy Hook, N. Y., to Liverpool in 13 days 1 hour 25 minutes. The Dreadnaught once went from New York to Liverpool in 13 days 8 hours. She was built in 1853 at Newburyport, Mass. She was 217 feet long, 40 feet wide, 26 feet deep, 1,443 gross tons. She was lost, July 4, 1869, on Cape Penas, northeast of Terra del Fuego, South America, on the way from Liverpool to San Francisco.

The sailing ship Northern Light went from San Francisco to Boston, via Cape Horn, in 76 days and 8 hours. The Andrew Jackson sailed from New York to San Francisco in 80 days and 4 hours. The Dreadnaught went from Honolulu to New Bedford, Mass., 13,470 miles, in 82 days. The Sovereign of the Seas sailed from Honolulu to New York in 88 days. The Natchez sailed from Canton, China, to New York in 76 days. The Trade Wind, in 1853, sailed from San Francisco to New York in 75 days. The Lightning, in 1854, sailed from Australia to Liverpool in 64 days. The bark Dawn of New York sailed from Buenos Ayres to New York in 36 days. The Nabob, of Boston, went from New York to Rangoon (Burmah), India, in 75 days. The Flying Dutchman in 1852-3 made a round trip, New York to San Francisco and return (27,220 miles), in 201 days. On the way home she sailed from San Francisco to Cape Horn in 35 days.

The clipper ships often beat the time of the steamships between New York and Ireland.

*Steamships*—The first steamship to cross the Atlantic was the Savannah, 350 tons, built at New York City, which left Savannah, Ga., on May 24, 1819, and reached Liverpool in 26 days, during eighteen of which she used her side-paddles. The Great Western, on her maiden voyage, from Bristol, England, to New York, covered the distance, in April, 1838, in 15 days. The Sirius, in April, 1838, went from England to New York in 18½ days. The Britannia, first Cunard liner, in July, 1840, came from Liverpool to New York in 14 days 8 hours. The Great Western's best record across the ocean was 10 days 10 hours 15 minutes. In May, 1851, the Pacific reduced the Atlantic record to 9 days 19 hours 25 minutes. The Persia, in 1856, did it in 9 days 1 hour 45 minutes; the Scotia, in 1866, in 8 days 2 hours 48 minutes; the City of Brussels, in 1869, in 7 days 22 hours 3 minutes; the Baltic, in 1873, in 7 days 20 hours 9 minutes; the City of Berlin, in 1875, in 7 days 15 hours 48 minutes; the Arizona, in 1880, in 7 days 7 hours 23 minutes; the Alaska, in 1882, in 6 days 18 hours 37 minutes; the Etruria, in 1888, in 6 days 1 hour 55 minutes; the Majestic, in 1891, in 5 days 18 hours 8 minutes; the Lucania, in 1894, in 5 days 7 hours 23 minutes; the Lusitania, in 1908, in 4 days 15 hours; the Mauretania, in 1910, in 4 days 10 hours 41 minutes. The foregoing records, since and including 1856, are between New York and Queenstown.

The best run from New York to Havre was made by the France, of the French Line, in 5 days 17 hours.

The quickest run from New York to San Francisco, via Straits of Magellan, was made by the Santa Cruz, an oil burner, in 1914, in 47 days 5 hours.

The day's-run record—676 knots—was made by the Mauretania, in January, 1911.

The U. S. destroyer Cole made 43.75 miles an hour on her trial sea trip. The motor boat Miss America, in 1920, on Lake George, N. Y., went at the rate of 77.85 miles an hour; the motor boat Maple Leaf VII. (August, 1921) made 80 miles an hour on the Solent, England.

### ACROSS THE ATLANTIC BY AIR.

The U. S. naval seaplane NC-4 (Read), in 1919 (May 16-27), flew from Trepassy, British North America, via the Azores, to Lisbon, Portugal, 2,150 miles, in 26 hours 45 minutes, actual flying time.

A British biplane (Alcock-Brown), in 1919 (June 14-15), flew from St. John's, N. F., to Clifden, Ireland, 1,960 miles, in 16 hours 12 minutes.

The British dirigible balloon R-34 (Scott), in 1919 (July), flew from East Fortune, Scotland, to Mineola, N. Y., 3,130 miles, in 108 hours 12 minutes, and returned from Mineola to Pulham, England, 3,200 miles, in 74 hours 56 minutes.

A hydroplane flew in 1922 from Portugal to Brazil.

### FASTEST TRIPS AROUND THE WORLD.

1889, by Nellie Bly, 72 days 6 hours 11 minutes; 1903, by Henry Frederick, 54 days 7 hours 20 minutes; 1911, by Andre Jaeger-Schmidt, 39 days 42 minutes 38 seconds; 1913, by John H. Mears, 35 days 21 hours, 36 minutes.

## RAILROAD TRAIN SPEED.

The modern locomotive can run 112 miles an hour on a heavy-rail, straight track, provided it is ballasted by a train behind it to keep it from jumping off. On account of curves and switches, the big coal consumption at high speed, and the frictional wear on the equipment 60 miles an hour is not often exceeded.

The fastest time on record for a distance of over 440 miles was made by the Lake Shore & Michigan Southern R.R. from Buffalo to Chicago, in June, 1905, noted above. The fastest long distance run less than 440 miles was on the New York Central R. R., September 11, 1895, from New York to Buffalo, 436½ miles, in 407 minutes actual time. Average speed, 64½ miles an hour, with two stops and 28 slow-ups, and on January 1, 1903, from Albany to Buffalo, 302 miles, in 295 minutes.

On August 15, 1898, on P. & R. and C. R. R. of N. J., "Royal Blue Line," between Elizabeth, N. J. and Jenkintown, a distance of 69 miles, in 61 minutes, including 2 slow-ups, some of the miles being traversed in 38 seconds.

On October 7, 1913, a special train on the Baltimore & Ohio, occupied by a party of baseball writers en route to report the World's Series, ran from Pittsburgh to Cumberland, Md., 147 miles, in 3 hours and 37 minutes, without stops, and from Cumberland to Baltimore, 190 miles, without stops, in 3 hours and 55 minutes, an average of 48.7 miles per hour. Both of these runs were made without taking water.

The Jarrett and Palmer special theatrical train, Jersey City to Oakland (San Francisco), 3,311 miles, June, 1876, 83 hours, 45 minutes; average speed, 39.53 miles per hour.

In May, 1906, the "Harriman Special" made the run from Oakland, Cal., to New York City in 71 hours, 27 minutes.

A special train of an engine and two cars, which was run in January, 1911, to carry J. P. Morgan from Washington to New York over the Pennsylvania Railroad, made the trip of 226.8 miles in 3 hours, 55 minutes and 30 seconds, or at the rate of 57.8 miles an hour.

## IMPORTANT TUNNELS OF THE WORLD.

ALBERG—Under the Alps at the Arl Mountains, and extends from Langen to St. Anton, 6¾ miles: opened 1884.
Andes Mountains—See "Trans-Andine."
Big Bend—Drains the Feather River in California, 2 miles; opened 1886.
Bitter Root Mountains (Montana and Idaho)—10,100 feet long.
Blackwell—Under River Thames, England, 1½ miles; opened 1897.
Busk-Ivanhoe Tunnel on the Colorado Midland R. R., 9,600 feet long, single track, under the Continental Divide, in Lake and Pitkin Counties.
Cascade Mountain—Through the Cascade Mountains in Washington, 3 miles.
Catskill Aqueduct—92 miles to N. Y. City, and 35 miles of distributing tunnels deep down under the city itself; partly opened in 1915, completely in 1917.
Connaught—Through Selkirk Mountains, under Rogers Pass, Canada; on Canadian Pacific Railway, double track, about five miles long; completed 1916.
Continental Divide, for the Denver and Salt Lake R. R., 6.4 miles long (under survey).
Croton Aqueduct—33⅛ miles to N. Y. City; opened 1888.
Cumberland—Under Cumberland Mountains, Tennessee, 8,000 feet long.
Detroit (Mich. Central Ry.)—Under Detroit River.
Gunnison—Southwestern Colorado, 6 miles; opened 1909.
Hoosac—Through Hoosac Mountains, Mass., 4¾ miles; opened 1873.
Khojak Pass—India, Quetta to Kandahar, 2 miles.
Loetschberg—Through the Alps, in Oberland, Switzerland, 9¼ miles; opened June 20, 1913, costing nearly $10,000,000.
Mont Cenis—Italy to France, under the Col de Frejus, 8 miles; opened 1871.
Mont d'Or—Between France and Switzerland, was bored through October 2, 1913. The tunnel pierces the Jura Mountains from Fresne to Vallorbe, and is 3¾ miles long.
Mt. Roberts—From the shore of Gastineau Channel at Juneau, Alaska, into Silver Bow Basin, 1 1-3 miles.
Otira—In New Zealand. 5 1-3 miles.
Rove—Northwest from l'Estaque, France, part of canal connecting Marseilles with Rhone River; 4½ miles, 72 feet wide, 47 feet high; opened 1916.
Rothschönberg—Drains the Felberg mines, Saxony, 31½ miles; opened 1877.
St. Clair—Under St. Clair River from Sarnia, Ont., to Port Huron, Mich., 2 miles; opened 1891.
St. Gothard—Through the Alps, connects Goschenen with Airolo, in Switzerland, 9 1-3 miles; opened 1881.
Severn—From Monmouthshire to Gloucestershire England, 4½ miles; opened 1886.
Simplon—Through the Alps, 12½ miles; opened 1905.
Spiral—The tunnels on the Canadian Pacific Railway, between Hector and Fields, B. C., consists of two spiral tubes, the westerly, 3,255 feet long, under Catnedral Mountain; and the easterly, 2,921 feet long, under Mt. Ogden, with the Kicking Horse River between. This line was built to reduce grades through the Kicking Horse Pass, and cut the gradient on tne line from 4.5% to 2.2%, and cost approximately $1,500,000.
Strawberry—Through tne Wasatch Mountains.
Sutro—Drains the Comstock Lode in Nevada, 4½ miles; opened 1879.
Totley—England, 3¾ miles.
Trans-Andine Ry. Tunnel—5 miles long, 10,486 feet above sea level and affords direct communication between Valparaiso and Buenos Ayres; opened April 5, 1910.
Wasserfluh—In the Alps, between Bunnadern and Lichtensteig, Switz., 2 miles, opened 1909.
Woodhead—Liverpool to Birkenhead, Eng., under the River Mersey, 3 miles.

## VALUE AND WEIGHT OF GOLD.

(By the United States Assay Office, New York.)

The unit in weighing gold is the troy ounce. A "fine" ounce means an ounce of pure gold. The mint value of gold does not fluctuate but remains constant at $20.67183462 per fine ounce. Troy measure is used in weighing gold. The grain is the same in both troy and avoirdupois measure but the ounce and the pound are not the same. The troy ounce contains 480 grains and the troy pound 5,760 grains, there being 12 ounces to the pound. The troy pound is never used in weighing gold, even when the weights of large quantities are to be computed. The avoirdupois ounce contains 437½ grains and the avoirdupois pound contains 7,000 grains, there being 16 ounces to the pound.

## FOREIGN COINS VALUED IN UNITED STATES MONEY.

(Proclaimed by the Secretary of the Treasury as of July 1, 1922.)

Argentine Republic, G., Peso ($0.9648). Currency: Paper, normally convertible at 44 per cent. of face value; now inconvertible.

The Attica mina or pound = 11 oz. 7 pwt. 16 2-7 gr., Troy.
The Attica talent (60 minae) = 56 lbs. 11 oz. 0 pwt. 17 1-7 gr., Troy.

### DRY MEASURE.

The Roman modus = 1 pk. 2-9 pint.
The Attic choenix = nearly 1½ pints.
The Attic medimnus = 4 pk. 6 1-10 pints.

### LIQUID MEASURE.

The cotyle = a little over ½ pint.
The cyathus = a little over 1½ pints.
The chus = a little over 6¾ pints.

### LONG MEASURE.

The Roman foot = 11 3-5 inches.
The Roman cubit = 1 ft. 5¾ inches.
The Roman pace = 4 ft. 10 inches.
The Roman furlong = 604 ft. 10 inches.
The Roman mile = 4,835 feet.
The Grecian cubit = 1 ft. 6½ inches.
The Grecian furlong = 504 ft. 4 1-5 inches.
The Grecian mile = 4,030 feet.

### MONEY.

The quadrans = 1 1-10 mills.
The as = 1 3-10 mills.
The sestertius = 3.58 + cents.
The sestertium (1,000 sestertii) = $35.80.
The denarius = 14.35 + cents.
The Attic obolus = 2.39 + cents.
The drachma = 14.35 + cents.
The mina (100 drachmae) = $14.35 +.
The talent (60 minae) = $861.00.
The Greek stater was worth $4; the Persian, $5.35. Each coin was of silver, composed of 20 drachmas, each drachma equal in value to 19½ cents, American money.

The modern drachma equals 19.3 cents. The Greek stater weighed 134.75 grains avoirdupois. The Roman aureus was worth $4.50.

## BIBLICAL WEIGHTS REDUCED TO TROY WEIGHT.

THE Gerah, one-twentieth of a Shekel, 12 grains; the Bekah, half a Shekel, 5 pennyweight; the Shekel, 10 pennyweight; the Maneh, 60 Shekels, 2 lbs. 6 oz.; the Talent, 50 Manehs, or 3,000 Shekels, 125 lbs.

## STANDARD NEWSPAPER MEASURES.

TYPE is measured by the number of "points" in the height of the face thereof. A "point" is approximately one-seventy-second of an inch (actually .01383 inch). There are 996 "points" in 35 centimeters. Nonpareil type, the size generally used by newspapers, is a 6-point type, and therefore sets 12 lines to an inch, measuring up and down the column. Twenty-four lines of nonpareil type make what is commonly called a "stick." There are usually ten "sticks" of type in a newspaper column. The smallest type in ordinary use is ruby, which is 3½ points in height. Diamond type is 4 or 4½ points; pearl, 5 points; agate, 5½ points; nonpareil, 6 points; minion, 7 points; brevier, 8 points; bourgeois, 9 points; long primer, 10 points; small pica, 11 points; pica, 12 points; English, 14 points; great primer, 18 points. The news columns in The World are almost 2 and three-sixteenths inches wide, equal to 12½ "picas" or pica M-quads. Each size of type has its own M-quad, which is the square of the face of the capital M of that size of type. A quadrat, or quad, is the type without a letter on it, and is used in spacing between words and in filling out blank lines. The quad is usually of four sizes—N-quad, M-quad, 2M-quad, and 3M-quad. In the old days of setting type by hand, a good printer could average 40 lines of nonpareil an hour, equal to 1,000 Ms of that type. A good operator, setting by machine, say on the linotype, can average 180 lines of nonpareil an hour.

## ROMAN AND ARABIC NUMERALS.

NOTE—A dash line over a numeral, multiplies the value by 1,000: thus, $\overline{X}$=10,000; $\overline{L}$=50,000; $\overline{C}$=100,000; $\overline{D}$=500,000; $\overline{M}$=1,000,000; $\overline{CLIX}$=159,000; $\overline{DLCX}$=550,140.

Other general rules in Roman numerals are as follows: (1), repeating a letter repeats its value—XX=20; CCC=300; (2), a letter placed after one of greater value adds thereto—VI=6; DC=600; (3), a letter placed before one of greater value subtracts therefrom—IV=4; IX=9; XC=90; (4), a letter between two of greater value gives to the three, taken together, a value equal to that caused by subtracting the middle letter from the sum of the others—XIV=14; LIX=59.

*Arabic* numerals are those now commonly in use—0, 1, 2, 3, 4, 5, 6, 7, 8, 9, etc.

## KNOTS AND MILES.

THE **U. S. and British Statute Mile** is 5,280 feet. The **British Admiralty Knot or Nautical Mile** is 6,080 feet. The **Statute Knot** is 6,082.66 feet, and is generally considered the standard. The number of feet in a statute knot is arrived at thus: The circumference of the earth is divided into 360 degrees, each degree containing 60 knots or (360x60) 21,600 knots to the circumference. 21,600 divided into 131,385,456—the number of feet in the earth's circumference—gives 6,082.66 feet—the length of a standard mile.

**A Knot** = 1.151 statute miles; a **Fathom** = 6 feet; a **Cable** = 600 feet.

The weight of a cubic foot of distilled water at a temperature of 60 F. is 1,000 ounces avoirdupois, *very nearly*, therefore the weight (in ounces, avoirdupois) of a cubic foot of any of the substances in the above table is found by multiplying the specific gravities by 10, thus:—one cubic foot of oak weighs 1,170 ounces; one cubic foot of marble 2,700 ounces, and so on.

One northern hardwood tree of any variety, 21 inches in diameter 5 feet above the ground, will yield one cord of wood. A southern softwood tree 23 inches in diameter will yield a cord. It takes 35 northern and 25 southern hardwood trees 5 inches in diameter 5 feet above the ground, to yield one cord.

Wind reduces the velocity of sound much more than fog or rain does. Explosions cannot be distinguished separately when but 1-16 second apart. Sound in water travels 4,708 feet a second; in wood it goes at least 10,000 feet a second; in metals, at least 4,000 feet a second.

## SPEED OF A FALLING BODY.

(By Prof. George B. Pegram of Columbia.)

IN the first second of its descent a body falls 16 feet; second second, 16+32=48 feet; third second, 16+64=80 feet; fourth second, 16+96=112 feet; fifth second, 16+128=144 feet; nth second, 16+32 (n-1) feet.

The total distance fallen by a body at the end of the nth second is 16n2 feet, thus at the end of the first second it has fallen 16 feet, at the end of the second 64 feet, at the end of the fifth 400 feet. The figures given above are only approximate ones and in them no account is taken of air resistance. As the air resistance encountered by a falling body depends on the shape and size of the body no general rule can be given for taking account of it, except to say that the air resistance increases with the velocity. The force of gravity on a body one mile above the surface of the earth is less than if the body were at the surface of the earth by about one-twentieth of one per cent., a difference which it would be difficult to measure in the rate of fall of the body.

## AREAS OF CIRCLES.

To find the circumference of a circle multiply the diameter by 3.14159265 (commonly expressed as 3.1416). To find the area of a circle multiply the square of the diameter by .785398 (usually expressed as .7854). To find the cubic contents of a cylinder or pipe, multiply the area by the height or depth. Thus, a pipe 1 foot in diameter and 1 foot in length, contains .7854 cubic feet. To find how many gallons are contained in a pipe or cylinder, divide the cubic contents by 231, which is the number of cubic inches in a United States gallon.

## MELTING POINTS OF CHEMICAL ELEMENTS, ETC.

(By the Bureau of Standards, U. S. Dept. of Commerce.)

THE values of the melting points used by the Bureau of Standards as standard temperatures for the calibration of thermometers and pyrometers are indicated in capitals. The other values have been assigned after a careful survey of all the available data. As nearly as may be, all values, in particular the standard points, have been reduced to a common scale, the thermodynamic scale. For all purposes except the most accurate investigations, the thermodynamic scale is identical with any of the gas scale. At high temperatures some of the values are quite uncertain; thus, while the melting point of platinum may be considered accurately known to 10° C., that of tungsten is possibly uncertain by 50° C. or more. Temperatures centigrade are rounded off, and the exact Fahrenheit equivalents are usually given.

Every human death may be attributed to one of three causes: (1) Interference with respiration (asphyxia or apnea); (2) Interference with the heart's action (syncope), and (3) Interference with the nervous system (coma or shock). The number of distinct diseases producing death is limited.

The length of the humerus multiplied by 5.06, or the length of the femur multiplied by 3.66, equals the height of the man. Thus the height of prehistoric peoples can be worked out.

In height man may vary from 1m. 25 (4 feet 1 inch) to 1m. 99 (6 feet 6¾ inches). Below 1m. 25 man is abnormal or pathological (dwarfism); above 2 meters man is also abnormal (giantism). Both these extremes are sterile. The extreme averages of different populations run from 1m. 38 (4 feet 6 inches) to 1m. 79 (5 feet 10.5 inches); the Scots of Galloway or Scots or the North are 1m. 78. The stature of man is not more than 2 or 3 centimeters higher than his skeleton.

The length of the trunk in man is more than one-third and less than two-fifths of the height. The arm reach in American soldiers, compared to their height, is as 1,043 to 1,000. The brains of the higher apes are much less complex in their convolutions and much less in both relative and absolute weight. The gorilla's brain barely exceeds twenty ounces in weight, while man's brain hardly weighs less than thirty-two.

From 11,000 brains weighed, Topinard finds an average weight of 1,361 grains for man and 1,290 grains for woman.

The gray substance represents 37 to 38 per cent. of the total weight of the brain. The differences in the form and the dimensions of the skull in correlation with those of the brain serve to distinguish races and species. Thus the Inka bone (one of the wormian bones), between the parietal and occipital bones, is frequent in Peruvian crania—20 times in 100; in negroes 6 times; in Europeans it is still more rare; among Indians of Arizona this bone is more frequent than among Peruvians. The suture of the alar bone is peculiar to Japanese crania—25 to 40 per cent., and only 9 per cent. in European races.

# The Metric System.

(Prepared for the U. S. Government by the Bureau of Standards Department of Commerce.)

## UNITS OF WEIGHT AND MEASURE.

THE fundamental unit of the metric system is the meter, the unit of length. From this the units of capacity (liter) and of weight (gram) were derived. All other units are the decimal subdivisions or multiples of these. These three units are simply related, e. g., for all practical purposes 1 cubic decimeter equals 1 liter and 1 liter of water weighs 1 kilogram. The metric tables are formed by combining the words "meter," "gram," and "liter" with the six numerical prefixes, as in the following tables:

| PREFIXES. | Meaning. | | Units. |
|---|---|---|---|
| milli- | = *one-thousandth* . . | .001 | |
| centi- | = *one-hundredth* . . . | .01 | "meter" *for length* |
| deci- | = *one-tenth* . . . . . | .1 | "gram" *for weight* |
| . . . . . | *Unit* = *one* . . . . . | 1 | *or mass.* |

| PREFIXES. | Meaning. | | Units. |
|---|---|---|---|
| deka- | = *ten* . . . . . | 10 | |
| hecto- | = *one hundred* . . . . . | 100 | "liter" *for capacity.* |
| kilo- | = *one thousand* . . . . | 1000 | |

All lengths, areas, and cubic measures in the following tables are derived from the international meter, the legal equivalent being 1 meter = 39.37 inches (law of July 28, 1866). In 1893 the United States Office of Standard Weights and Measures was authorized to derive the yard from the meter, using for the purpose the relation legalized in 1866, 1 yard = 3600-3937 meter. The customary weights are likewise referred to the kilogram (Executive order approved April 5, 1893). This action fixed the values, inasmuch as the reference standards are as perfect and unalterable as it is possible for human skill to make them at this time. All capacities are based on the equivalent 1 liter equals 1.000027 cubic decimeters. The decimeter is equal to 3.937 inches in accordance with the legal equivalent of the meter given above. The gallon referred to in the tables is the United States gallon of 231 cubic inches. The bushel is the United States bushel of 2,150.42 cubic inches. These units must not be confused with the British units of the same name, which differ from those used in the United States. The British gallon is approximately 20 per cent. larger and the British bushel 3 per cent. larger than the corresponding units used in this country. The customary weights derived from the international kilogram are based on the value 1 avoirdupois pound = 453.5924277 grams. The value of the troy pound is based upon the relation just mentioned and also the equivalent 5760-7000 avoirdupois pounds equals 1 troy pound.

## STANDARDS FOR MEASUREMENT.

Units of measurement should be distinguished from standards for measurement, particularly in the case of length and capacity. Units of length are fixed distances, independent of any other consideration, while length standards are affected by the expansion and contraction with changes of temperature of the material of which the standard may be composed. It is therefore necessary to fix upon some temperature at which the distance between the defining lines or end surfaces of the standards shall be equal to the unit. The same is true of standards of capacity, which at some definite temperature contain a given number of units of volume. The temperature at which metric length standards are customarily made correct is 0° C, although 20° C is also used for steel tapes and some other standards intended for use at room or average outdoor temperatures. The temperature at which standards of length of the customary system are made correct is 62° F.

For measurements of high precision it is also necessary to specify the manner of support of the standards, whether at certain points only or throughout their entire length, and in the case of tapes it is also necessary to give the tension applied to the tape when in use. In the United States the capacity standards, both metric and customary, are made to hold the specified volumes at 4° C. Standards of capacity are usually made of brass so the capacity at any other temperature may be computed by the use of the coefficient of cubical expansion, usually assumed to be 0.000054 per degree Centigrade. In the purchase and sale of liquids a more important consideration than the temperature of the measures is the temperature of the liquid when measured, for the reason that the large coefficient of expansion of many liquids makes the actual mass of a given volume delivered vary considerably with temperature. For this reason, the custom of buying and selling liquids by weight instead of by measure is recommended. It is further recommended that, when liquids are sold by volume, 68° F or 20° C be adopted as the standard temperature of the liquid.

While the temperature of a weight does not affect its mass, it is nevertheless important that when two weights are compared in air they both be at the same temperature as the air. If there is a difference between the temperature of the air and the weights, convection currents will be set up and the readings of the balance will be thereby affected. Also, since weights are buoyed up by the surrounding air by amounts dependent upon their volumes, it is desirable that the weights of any set be of the same material. If two weights of the same density balance in air of a certain density they will balance in vacuo or in air of a different density. Brass is the material most widely used for standard weights, although platinum is quite commonly used for weights of 1 gram or less. In the absence of any knowledge as to the actual density of weights, those made of brass are assumed to have a density of 8.4 at 0° C, while those of platinum are assumed to have a density of 21.5 at 0° C.

## SPELLING AND ABBREVIATION OF UNITS.

Following the names of each unit in the list below is given the abbreviation which the Bureau has adopted. Attention is called to the following principles: 1. The period is omitted after the abbreviations of the metric units, while it is used after those of the customary system. 2. The exponents, "2" and "3," are used to signify area and volume, respectively, in the case of the metric units instead of the longer prefixes "sq." or "cu." In conformity with this principle the abbreviation for cubic centimeter is "cm3," instead of "c. c." or "c. cm." The term "cubic centimeter" as used in chemical work is, in fact, a misnomer, since the unit actually used is the "milliliter," which has a slightly larger volume. 3. The use of the same abbreviation for both singular and plural is recommended. This practice is already established in expressing metric units and is in accordance with the spirit and chief purpose of abbreviations.

## DEFINITIONS OF UNITS.

### LENGTH.

*Fundamental Units*—A meter (m) is a unit of length equivalent to the distance between the defining lines of the international prototype meter at the International Bureau of Weights and Measures when this standard is at the temperature of melting ice (0° C).

A yard (yd.) is a unit of length equivalent to 3600-3937 of a meter.

*Multiples and submultiples:*

1 kilometer = 1000 meters.
1 hectometer = 100 meters.
1 dekameter = 10 meters.
1 decimeter = 0.1 meter.
1 centimeter = 0.01 meter.
1 millimeter = 0.001 meter = 0.1 centimeter.
1 micron = 0.000001 meter = 0.001 millimeter.
1 millimicron = 0.000000001 meter = 0.001 micron.
1 foot = 1-3 yard = 1200-3937 meter.
1 inch = 1-36 yard = 1-12 foot = 100-3937 meter.
1 link = 0.22 yard = 7.92 inches.
1 rod = 5½ yards = 16½ feet.
1 chain = 22 yards = 100 links = 66 feet = 4 rods.
1 furlong = 220 yards = 40 rods = 10 chains.
1 statute mile = 1760 yards = 5280 feet = 320 rods.
1 hand = 4 inches.
1 point = 1-72 inch.
1 mil = 0.001 inch.
1 fathom = 6 feet.
1 span = 9 inches = 1-8 fathom.
1 nautical mile { United States = 6080.20 feet
1 sea mile { = 1.151553 statute miles.
1 geographical mile { = 1853.249 meters.

## AREA.

*Fundamental Units:*

A square meter is a unit of area equivalent to the area of a square the sides of which are 1 meter.

A square yard is a unit of area eq ivalent to the area of a square the sides of which are 1 yard.

*Multiples and Submultiples:*

1 square kilometer = 1,000,000 square meters.
1 hectare or square hectometer = 10,000 square meters.
1 are or square dekameter = 100 square meters.
1 centare = 1 square meter.
1 square decimeter = 0.01 square meter.
1 square centimeter = 0.0001 square meter.
1 square millimeter = 0 000001 square meter = 0.01 square centimeter.
1 square foot = 1-9 square yard.
1 square inch = 1-1296 square yard = 1-144 square foot.
1 square link = 0.0484 square yard = 62.7264 square inches.
1 square rod = 30.25 square yards = 272.25 square feet = 625 square links.
1 square chain = 484 square yards = 16 square rods = 100,000 square links.
1 acre = 4840 square yards = 160 square rods = 10 square chains.
1 square mile = 3,097,600 square yards = 640 acres.

## VOLUME.

*Fundamental Units:*

A cubic meter is a unit of volume equivalent to a cube the edges of which are 1 meter.

A cubic yard is a unit of volume equivalent to a cube the edges of which are 1 yard.

*Multiples and Submultiples:*

1 cubic kilometer = 1,000,000,000 cubic meters.
1 cubic hectometer = 1,000,000 cubic meters.
1 cubic dekameter = 1,000 cubic meters.
1 stere = 1 cubic meter
1 cubic decimeter = 0.001 cubic meter.
1 cubic centimeter = 0.000001 cubic meter = 0.001 cubic decimeter.
1 cubic millimeter = 0 000000001 cubic meter = 0.001 cubic centimeter.
1 cubic foot = 1-27 cubic yard.
1 cubic inch = 1-46656 cubic yard = 1-1728 cubic foot.
1 board foot = 144 cubic inches = 1-12 cubic foot.
1 cord = 128 cubic feet.

## CAPACITY.

*Fundamental Units:*

A liter is a unit of capacity equivalent to the volume occupied by the mass of 1 kilogram of pure water at its maximum density (at a temperature of 4° C, practically) and under the standard atmospheric pressure (of 760 mm). It is equivalent in volume to 1.000027 cubic decimeters.

A gallon is a unit of capacity equivalent to the volume of 231 cubic inches. It is used for the measurement of liquid commodities only.

A bushel is a unit of capacity equivalent to the volume of 2150.42 cubic inches. It is used in the measurement of dry commodities only.

The above bushel is the so-called stricken or struck bushel. Many dry commodities are sold by heaped bushel, which is generally specified in the State laws to be the usual stricken bushel measure "duly heaped in the form of a cone as high as the article will admit" or "heaped as high as may be without special effort or design." The heaped bushel was originally intended to be 25 per cent. greater than the stricken bushel.

*Multiples and Submultiples:*

1 hectoliter = 100 liters.
1 dekaliter = 10 liters.
1 deciliter = 0.1 liter.
1 centiliter = 0.01 liter.
1 milliliter = 0.001 liter = 1.000027 cubic centimeters
1 liquid quart = 1-4 gallon = 57.75 cubic inches.
1 liquid pint = 1-8 gallon = 1-2 liquid quart = 28.875 cubic inches.
1 gill = 1-32 gallon = 1-4 liquid pint = 7.21875 cubic inches.
1 fluid ounce = 1-128 gallon = 1-16 liquid pint.
1 fluid dram = 1-8 fluid ounce = 1-128 liquid pint
1 minim = 1-60 fluid dram = 1-480 fluid ounce.
1 firkin = 9 gallons
1 peck = 1-4 bushel = 537.605 cubic inches.
1 dry quart = 1-32 bushel = 1-8 peck = 67.200625 cubic inches.
1 dry pint = 1-64 bushel = 1-2 dry quart = 33.600-3125 cubic inches.
1 barrel (for fruit, vegetables and other dry commodities) = 7056 cubic inches = 105 dry quarts.

The barrel capacity was fixed by United States statute, approved March 4, 1915.

## MASS.

*Fundamental Units:*

A kilogram is a unit of mass equivalent to the mass of the international prototype kilogram at the International Bureau of Weights and Measures.

An avoirdupois pound is a unit of mass equivalent to 0.4535924277 kilogram.

A gram is a unit of mass equivalent to one-thousandth of the mass of the international prototype kilogram at the International Bureau of Weights and Measures.

A troy pound is a unit of mass equivalent to 5760-7000 of that of the avoirdupois pound.

*Multiples and Submultiples:*

1 metric ton = 1000 kilograms.
1 hectogram = 100 grams = 0.1 kilogram.
1 dekagram = 10 grams = 0.01 kilogram.
1 decigram = 0.1 gram.
1 centigram = 0.01 gram.
1 milligram = 0.001 gram.
1 avoirdupois ounce = 1-16 avoirdupois pound.
1 avoirdupois dram = 1-256 avoirdupois pound = 1-16 avoirdupois ounce.
1 grain = 1-7000 avoirdupois pound = 10-4375 avoirdupois ounce = 1-5760 troy pound.
1 apothecaries' pound = 1 troy pound = 5760-7000 avoirdupois pound.
1 apothecaries' or troy ounce = 1-12 troy pound = 480-7000 avoirdupois pound = 480 grains.
1 apothecaries dram = 1-96 apothecaries' pound = 1-8 apothecaries' ounce = 60 grains.
1 pennyweight = 1-20 troy ounce = 24 grains.
1 apothecaries' scruple = 1-3 apothecaries' dram = 20 grains.
1 metric carat = 200 milligrams = 0.2 gram.
1 short hundredweight = 100 avoirdupois pounds.
1 long hundredweight = 112 avoirdupois pounds.
1 short ton = 2000 avoirdupois pounds.
1 long ton = 2240 avoirdupois pounds.

## ENERGY RESOURCES OF THE WORLD.

THE United States is literally the most powerful country in the world, according to a statement made by Dr. Thomas T. Read of the Federal Bureau of Mines, before the School of Foreign Service of Georgetown University. "The real basis of power of a nation is its energy resources rather than its man-power strength," said Dr. Read. "The modern way to use the energy of a man is to employ it in a way similar to the little detonator of the big explosive shell—the little charge sets off the big one and does an amount of work far in excess of its own capacity. The energy output of an average workman is about a tenth of a horsepower. The energy expended by a coal miner in an eight-hour day thus amounts to about that available from two pounds of coal. A Japanese miner who gets out 1,400 pounds of coal a day, thus multiplies his energy by 700. It is somewhat like planting one grain of wheat and having 700 grow from it.

"The American miner gets out 8,800 pounds of coal in a day and so multiplies his energy by 4,400. There are 41,000,000 wage earners in the United States and their energy output is a little over 4,000,000 horsepower, or only nine times the potential energy output in the form of coal of 100 miners. The power minerals, coal, petroleum, and waterpower, are, therefore, the real sources of strength in an industrial civilization. Just where the United States stands on this basis is best brought out by some comparative figures which may be stated in millions of horsepower years, so that the figures will be easier to handle. Taking the estimates of probable and possible available coal, petroleum, and waterpower in the principal countries of the world, and reckoning them in terms of millions of horsepower years, they line up something like this:

| COUNTRY. | Coal (Millions of Hp. Years). | Petr'le'm (Millions of Hp. Years). | Waterpower (Millions of Hp. Years). | COUNTRY. | Coal (Millions of Hp. Years). | Petr'le'm (Millions of Hp. Years). | Waterpower (Millions of Hp. Years). |
|---|---|---|---|---|---|---|---|
| United States | 500,000 | 400 | 37 | Australasia | 19,000 | (?) | 4 |
| China | 200,000 | 60 | 20 | Russia | 17,000 | 280 | 16 |
| Germany | 48,000 | 2 | 2½ | Poland and Czecho-Slovakia | 14,000 | 45 | 1 |
| Canada | 40,000 | 40 | 22½ | India | 11,000 | 70 | 27 |
| Great Britain | 27 000 | (?) | 1 | | | | |

"No other country has as much as one-fiftieth part of the total energy resources as the United States. The United States had resources before 1492 even greater than now because they were all unused. China is in somewhat the same position to-day as the United States was 400 years ago. Japan, on the other hand, is an example of a country that has developed its very limited resources to a large extent. Japan's energy resources are less than one five-hundredth part of those of the United States, and therefore the Japanese cannot afford to use their energy for rough uses that require large quantities, such as in breaking stone.

## CLASSIFICATION OF ROCKS AND DIVISIONS OF GEOLOGIC TIME.

(Prepared by the U. S. Geological Survey.)

THE rocks composing the earth's crust are grouped by geologists into three great classes—igneous, sedimentary, and metamorphic. The igneous rocks have solidified from a molten state. Those that have solidified beneath the surface are known as intrusive rocks. Those that have flowed out over the surface are known as effusive rocks, extrusive rocks, or lavas. The term volcanic rock includes not only lavas but bombs, pumice, tuff, volcanic ash and other fragmental materials thrown out from volcanoes. Sedimentary rocks are formed by the accumulation of sediment in water (aqueous deposits or eolian deposits). The sediment may consist of rock fragments or particles of various sizes (conglomerate, sandstone, shale); of the remains or products of animals or plants (certain limestones and coal); of the product of chemical action or of evaporation (salt, gypsum, &c.); or of mixtures of these materials. A characteristic feature of sedimentary deposits is a layered structure known as bedding or stratification. Metamorphic rocks are derivatives of igneous or sedimentary rocks produced through mechanical or chemical activities in the earth's crust. The unaltered sedimentary rocks are commonly stratified, and it is from their order of succession and that of their contained fossils that the fundamental data of historical geology have been deduced.

### LAND AND WATER AREAS.

THE superficial area of the earth is 196,940,000 square miles—140,295,000 square miles of water and 56,255,000 square miles of land. The three great oceans comprise the Atlantic, 41,321,000 square miles; Pacific, 68,634,000 square miles, and Indian, 29,430,000 square miles. There are about 1,000,000 square miles of lake and river surface on the land, and 1,910,000 square miles of islands in the seas. The diameter of the earth at the equator is 7,926 miles, and through the poles 7,899.6 miles. The average elevation of the land above sea level is 2,300 feet. The average depth of the ocean below sea level is 12,600 feet. The deepest place in the ocean yet found is off Mindanao, Philippine Islands, 32,088 feet. The highest mountain is Mount Everest, in the Himalayas, 29,002 feet. This gives a range of 61,090 feet or more than 11½ miles between the bottom of the oceans and the top of the land. The greatest depth in the Atlantic Ocean is near Porto Rico, 31,366 feet; in the Indian Ocean, 22,968; in the Arctic, 13,200; in the Malay, 21,342; in the Caribbean, 20,568; in the Mediterranean, 12,276; in the Bering, 13,422.

The best estimates of the earth's area place the fertile regions at 29,000,000 square miles; steppes at 14,000,000 square miles; deserts at 4,861,000 square miles.

Areas in square miles of seas: Okhotsk, 580,000; Yellow, 480,000; Japan, 405,000; Andaman, 300,000; North, 220,000; Red, 178,000; Baltic, 160,000; Hudson Bay, 472,000.

The population of the earth at the death of Emperor Augustus, estimated by Bodio, was 54,000,000. The population of Europe hardly exceeded 50,000,000 before the fifteenth century.—*Mulhall.* The population of the earth at its present ratio of gain will be about 4,000,000,000 in 2014.

Abbe Theodore Moreaux, director of the observatory of Bourges, in an article in La Revue du Ciel, declares the world to be 500,000,000 years old. Life, Abbe Moreaux says, has existed on the earth for at least 240,000,000 to 260,000,000 years, although it has not been human life. He says the moon was not once part of the earth, but was a sun, since extinct, but it formerly aided in warming the earth.

The Jews in the world are estimated at 15,500,000, of whom 3,500,000 are in the United States (1,500,000 in N. Y. City); 10,500,000 in Europe; in Asia, 500,000; and the rest chiefly in Africa and South America.

## UPPER AIR WINDS AND CONDITIONS.

Numerous observations with kites and balloons give the following information relative to upper air winds:

1. In general winds a short distance above the ground blow from points slightly to the right of those at the surface; at greater heights this clockwise turning increases in the case of southerly winds, i. e., ESE to WSW, but northerly winds, especially those from NNW to ENE, turn counter-clockwise with altitude. For example, above SE winds at the surface there are found SSW to WSW winds as a rule; above NE winds, it is usual to find NNW to WNW winds.

2. On the average, wind speeds increase sharply, about 100%, within 1,500 feet above the surface. This rule applies to all directions. At greater heights the increase is more gradual, and in many cases, especially with easterly winds in summer, there is an actual decrease. The largest increases are found above surface SW to NW winds.

3. Winds in the upper air are prevailingly from a westerly direction, i. e., SSW to NNW. At heights of two or three miles and thence to six or seven miles this preponderance amounts to about 90%. When easterly winds are found at these heights they are usually of low velocity. Westerly winds, on the other hand, continue to increase in speed, reaching a maximum at altitudes of about six or seven miles. At still greater heights a decrease in speed is found.

4. The characteristics indicated in 1, 2, and 3 are more pronounced in winter than in summer and in the northern than in the southern part of the country.

5. Although westerly winds are usually found, they are not to be placed in the category of "trade winds," since large variations, both in speed and direction, are found from place to place, from season to season, and even from day to day.

The Weather Bureau, Washington, D. C., issues twice daily "flying weather" forecasts which are sent to all aviation fields in the country and in addition are broadcast from Arlington, so that any one having a radio receiving set can easily obtain information as to the probable upper air conditions of wind, etc. A similar message is broadcast from San Francisco for the benefit of Pacific Coast flyers. In addition to this service, the Weather Bureau is in possession of much detailed information as to upper air conditions, means, extremes, etc., and careful attention is always given to specific requests by letter, or otherwise, for such information.

## TELESCOPES.

The magnifying power of telescopes is generally expressed in diameters, the practical limit of power being 100 diameters per inch of diameter of the telescope. Thus the 36-inch telescope at the Lick Observatory may give a magnifying power of 3,600 diameters. But such high power can only be used in a very tranquil atmosphere; consequently most astronomical observations are made at 1,000 diameters or less.

The largest refracting telescopes in the world are in the United States. The one at Yerkes Observatory, Geneva Lake, Wis., has an object lens 40 inches in diameter, with a focal length of 64 feet. The movable part of the instrument turning on the polar axis weighs about 12 tons, and the clock 1½ tons. Other large telescopes are the 36-inch at Lick Observatory, Mt. Hamilton, Cal., where many important astronomical discoveries have been made; the 26-inch at the U. S. Observatory, Washington, D. C., and the 24-inch (photographic objective) belonging to Harvard University, now at the Arequipa, Peru, station of the Harvard Observatory. There is a 30-inch refracting telescope at the Allegheny Observatory, Riverview Park, Pa.

Abroad is the 30-inch at the Imperial Observatory Pulkova (near Petrograd), Russia. This telescope has a platform at the lower end of the polar axis from which observers can readily operate the instrument. The Meudon Observatory (near Paris, France), has a 32-inch; the Potsdam, Prussia, a 31-inch; and the Royal Observatory, at Greenwich, England, a 28-inch.

Two of the most perfect reflecting telescope instruments ever built are at Mt. Wilson Observatory, Pasadena, Cal. One mirror is silver on glass, 60 inches in diameter, and weighs nearly a ton. The telescope is moved by electric motors in right ascension and declination. An important feature in this instrument is the different focal lengths that can be obtained. The 60-inch mirror has a 25-foot focus, but by a suitable arrangement of mirrors it is possible to get focal lengths of 80, 100 and 150 feet. At the same observatory is a 100-inch reflector, the tube with the mirror at the bottom is 43 feet long, and with the mountings weighs nearly 20 tons. There is a 36-inch reflector at Lick Observatory, Harvard University has a 28-inch and a 60-inch, and at the Yerkes Observatory is a 24-inch. Other notable reflectors are the Lord Rosse, at Birr Castle, Ireland, which has a mirror 72 inches in diameter of speculum metal and a focal length of 54 feet; a 48-inch at Melbourne, Australia; a 60-inch at Ealing, England; a 48-inch at Paris, France, and a 39-inch at Meudon, France. A 61-inch reflecting telescope at the National Astronomic Observatory, Cordoba, Argentina, is under construction. The Dominion Astronomical Observatory, Victoria, B. C., Canada, has a 72-inch reflector.

## POETS-LAUREATE OF ENGLAND.

There is no authentic record of the origin of the office of Poet-Laureate of England. According to Warton, there was a *Versificator Regis*, or King's Poet, in the reign of Henry III. (1216-1272), and he was paid 100 shillings a year. Geoffrey Chaucer (1328-1400) assumed the title of Poet-Laureate, and in 1389 got a royal grant of a yearly allowance of wine. In the reign of Edward IV. (1461-1483) John Kay held the post. Under Henry VII. (1485-1509) Andrew Bernard was the Poet-Laureate, and was succeeded under Henry VIII. (1509-1547) by John Skelton. Next came Edmund Spenser, who died in 1599; then Samuel Daniel, who died in 1619; and after him, Ben Johnson (1574-1637), Sir William Davenant (1637-1668), John Dryden (1631-1700), who was deposed at the time of the Revolution. The others, with the date of appointment, when known, have been: Thomas Shadwell, 1689; Nahum Tate, 1692; Nicholas Rowe, 1715; the Rev. Laurence Eusden, 1718; Colly Cibber, 1730; William Whitehead, 1758, on the refusal of Gray; Rev. Thomas Warton, 1785, on the refusal of Mason; Henry J. Pye, 1790; Robert Southey, 1813, on the refusal of Sir Walter Scott; William Wordsworth, 1843; Alfred Tennyson, 1850; Alfred Austin, 1896; Robert Bridges, 1913.

## HISTORY OF WIRELESS TELEGRAPHY AND TELEPHONY.

(Prepared for THE WORLD ALMANAC by the American Telephone and Telegraph Co.)

EFFORTS to develop one form or another of wireless telegraphy go back nearly a century. Early experiments involved either volume distribution of electric current throughout a large area of moist earth or water, the propagation of energy from one circuit to another by electro-magnetic induction, or such propagation by means of electrostatic induction. These early systems, although experimentally tried, failed to become practicable, and the electric wave wireless telegraphy of the present day differs fundamentally in principle from any of them.

Wireless telegraphy may be said to trace its descent directly from the theoretical work of J. C. Maxwell who in 1865, as a result of his researches in mathematical physics, was led to make the prediction that visible light consists of electric waves in the ether. For years the importance of Maxwell's prediction was unrecognized because it lay undissociated from the complicated mathematical reasoning by which he had arrived at it. It was not until 1887 that interest was really aroused in the subject when Heinrich Hertz gave an experimental proof of the truth of Maxwell's prediction. Hertz showed that the ether of space would transmit electric waves and he showed how these waves might be produced and detected.

Following the work of Hertz, which received widespread attention, the suggestion was frequently made that the newly discovered waves might open the way to successful wireless telegraphy. However, the apparatus devised by Hertz for producing and detecting electric waves was in no way suitable to practicable adaptation.

### INVENTION OF THE COHERER.

In 1890 the remarkable fact was noted by Branly that metal filings when loosely packed in a small glass tube normally formed a very poor conductor of electricity but that they became a good conductor under the influence of a nearby electric spark, the action of the spark apparently being to weld the metal grains lightly together. Branly's device received the name *coherer* and it was found to be a much more sensitive means of detecting electric waves than the device which Hertz had used.

Between the years 1894 and 1896 Marconi initiated his experiments which were destined to become famous, first devoting himself to improvements in the coherer. He adopted an idea originating with Popoff of using an electro-magnetic buzzer to decohere the coherer between signals and also found that the coherer when placed between an earth connection and a wire running to a large metal screen supported in the air became a very sensitive detector of electric waves. At about the same time Marconi modified the original oscillator of Hertz by connecting one terminal of the spark gap to the earth and the other to a large aerial conductor. By this means, which constitutes the first use of what is now known as antenna, he was able to greatly increase the efficiency and amount of energy radiated from the oscillator.

Marconi tried out his developments in the field of space telegraphy in England in 1896 and by 1898 had succeeded in telegraphing a distance of 14½ miles. During the same year his apparatus was applied to a lightship and communication successfully established over a short stretch of water. By 1901 he had telegraphed from Cornwall to the Isle of Wight, a distance of 200 miles. At about this time he developed an oscillation transformer by means of which the coherer was inductively coupled to the receiving antenna.

### INDUCTIVE COUPLING.

In the use of inductive coupling, Marconi was anticipated by Sir Oliver Lodge who devised a wireless telegraph system in which such coupling was used and in which the natural period of the antenna circuit was made equal to the period of the oscillating circuit. Lodge's antenna was not earth connected like Marconi's but consisted of an upper and lower conducting surface, an arrangement which is coming into quite general use in recent years and is known as an antenna with counterpoise. Patents on inductive coupling and tuning were also taken out by Marconi, Arco and Slaby, Braun, Stone, and others. By the use of an auxiliary oscillating circuit, the capacity of which could be made much larger than the capacity of the antenna, means were provided for greatly increasing the amount of energy radiated as well as sharpening the frequency of radiation. In 1900 both Arco and Slaby and Marconi showed that two messages could be simultaneously received on different wave lengths by one antenna.

The next important development in spark sets came in 1908 with the invention by Wien of the quenched spark. The use of the quenched spark narrowed materially the band of wave lengths radiated from a transmitting station and made sharper tuning possible.

In 1902 Castelli, an officer in the Italian Navy, invented the first self-restoring coherer. This permitted the use of the ordinary telephone receiver as a receiving instrument and thereby very greatly improved the sensitiveness of the receiving set. Shortly afterward the magnetic and electrolytic detectors were developed, but while they were self-restoring they were never generally used because the crystal detectors, introduced in 1906 as a result of the work of Dunwoody and Picard in America, proved far more satisfactory in practically every respect.

### DEVELOPMENT OF THE ARC.

In 1903, Poulsen, of Denmark, developed a form of arc which was characterized by a hydrogen atmosphere surrounding the electrodes and a transverse magnetic electric field between the electrodes, the field being formed by solenoids through which the current feeding the arc flows. The Poulsen arc proved a very satisfactory generator of oscillating currents up to frequencies of 20,000 to 30,000 and as subsequently developed is used in many of the largest radio telegraph stations throughout the world. Arcs have recently been built, as for the Lafayette Station in France, which are capable of delivering 1,000 k. w. to an antenna.

The development of the arc, because it supplied a source of continuous waves, held certain promise of making radio telephony practicable but until the advent of the vacuum tube no satisfactory means was found of effecting the necessary modulation with speech frequencies.

Another form of continuous wave generator which has received much attention is the high frequency alternator. The names best known in this field are those of Goldschmidt and Alexanderson. In recent years the Alexanderson type of alternator has been the object of important developments by the General Electric Company and is being used extensively by the Radio Corporation of America in its large telegraph stations.

Briefly, the importance of continuous wave radio telegraph lies in the fact that it makes possible the use of larger amounts of power than the spark and it permits the generation of narrower bands of waves, thus tending to reduce interference between simultaneous messages. It also led to the introduction of heterodyne reception, by Fessenden about 1905.

### THE VACUUM TUBE.

Within the past few years the vacuum tube or thermionic amplifier has become one of the most important types of generator for continuous waves. It was introduced in 1906 by De Forest as a detector and amplifier of electric waves and although it proved under favorable conditions, to be extremely sensitive in these capacities it was not entirely reliable. The vacuum tube or "audion," as made by De Forest, contained an appreciable amount of residual gas within the evacuated bulb which proved to be largely responsible for its uncertain behavior. Because it gave promise of containing the germ of a sensitive electric amplifier, the Bell Telephone System became interested in developing it, beginning 1912, as a means of attaining transcontinental telephony. The telephone engineers undertook a thorough study of its electrical characteristics and applied means for thoroughly exhausting the gas. The resulting tubes acted so satisfactorily as telephone repeaters that the development of much larger power tubes was immediately undertaken with the object of applying them to radio telephony.

These developments produced vacuum tubes which were used successfully as continuous wave generators and speech modulators and led, in the year 1915, to a successful trial of transoceanic radio-telephony. The development of a vacuum tube in very large sizes is still in its infancy and there is every reason to believe that in the near future it will take its place beside the arc and alternator for the handling of very large amounts of energy, both for radio telegraphy and telephony.

The use of the vacuum tube detector and amplifier for receiving purposes, by making possible the detection of very faint signals, is at present giving rise to extensive use of the loop antenna for directive reception, and this in turn is leading to the erection of many radio compass stations and radio beacons for the supplying of ships' bearings to navigators at sea.

The vacuum tube has also been generally responsible for the rapid development during the past few years of radio-telephony for ship-to-shore

communication, for military purposes—especially for guiding aircraft—and for radio broadcasting.

Following are a few of the more important dates relating to the application of the radio telegraph and telephone to commercial and other uses, notably military and broadcasting:

### WIRELESS CHRONOLOGY.

1901—Marconi first succeeded in telegraphing certain signals across the Atlantic and in 1903 a complete message was sent.

1904—A regular telegraph service to handle press news and private messages was begun from Poldhu and Cape Breton to Atlantic liners. This led to the publication of small daily newspapers on board many of the transatlantic steamships.

1906—The use of radio-telegraphy by steamships had so demonstrated its value as a means of increasing the safety of travel at sea that an International Radio Convention was called in Berlin to consider the desirability of establishing certain uniform international practices. The articles of this convention, which dealt largely with the international use of the radio telegraph, particularly as concerned its use by ships at sea, were subscribed to by practically all nations.

1907—Press despatches were being handled by radio-telegraphy across the Atlantic.

1909—Collision between the steamships Republic and Florida occurred, and by summoning aid the radio-telegraph was instrumental in saving the lives of all on board. The first wireless shipping report was published at Lloyd's in 1910.

1912—The second International Radio-Telegraph Convention was signed at London; like the first one signed at Berlin it had to do especially with safety at sea.

1915—Experimental transoceanic telephony was first achieved, speech being transmitted by the Bell Telephone System engineers from Washington, D. C., to Paris and to Honolulu, the latter distance being nearly 5,000 miles. During the demonstration a telephone message was sent by wire from New York to Washington and then radiated from Washington to San Francisco, thus establishing the radio-telephone as a supplement to the wire system. It is this possibility which must lie at the heart of all successful ship-to-shore and transoceanic telephone systems.

1914-19—During the World War the value of the radio telegraph and telephone for many military and naval purposes was thoroughly established. The wireless telephone proved particularly useful as a means of directing aircraft.

1920—Following the close of the war, the development of the radio art in the United States was in danger of being seriously retarded because of the diversified ownership of essential patents. At the suggestion of the United States Government, the leading holders of these patents, namely the American Telephone & Telegraph Company, the General Electric Company, the Radio Corporation of America and the Westinghouse Electric and Manufacturing Company entered into a cross-licensing agreement permitting each company to avail itself of the patents of the others in its particular fields. By means of this agreement the greatest research and development staffs in the world have been freed to develop the public service feature of radio without fear of patent infringements.

1921-22—Many radio-telephone stations, located at New York, Newark, Pittsburgh, Schenectady, Chicago, and certain other cities, adopted the programme of broadcasting music and other entertainment regularly for the purpose of focusing popular interest upon radio. By October 6 the number of broadcasting stations was 546. California led with 66, Ohio second with 35, and New York third with 30. Fully 2,000,000 were "listening in" nightly and, as the average cost of a radio set is $75, the amount invested is $150,000,000.

## WHAT IT WAS THAT ALEXANDER GRAHAM BELL DISCOVERED.

(A. C. Curacy in the N. Y. Evening Post).

L'Illustration, Paris, August 26, 1854, contained an article by Charles Boursel, in which the electrical transmission of speech was predicted in the following words: "Suppose that a man speaks near a movable disk sufficiently flexible to lose none of the vibrations of the voice; that this disk alternately *makes and breaks* the connection from a battery; you may have at a distance another disk which will simultaneously execute the same vibrations."

Six years later, 1860, Philipp Reis built a device that he called a "telephone" upon the principle laid down by Boursel. The tenth and final form of the "transmitter" is known as the "square box pattern." It consists essentially of a square box, with a membrane in the cover and a mouthpiece in the side. At the centre of the membrane is a loose contact that *makes and breaks* the circuit when a sound directed into the box through the mouthpiece causes the membrane to vibrate. The best known form of "receiver" is the "knitting needle receiver." It consists essentially of a knitting needle wrapped with silk-insulated copper wire and mounted on a box which serves as a sounding board.

The Reis "receiver" operates on a principle that was discovered by C. G. Page, of Salem, Mass., in July, 1837—namely, that when a piece of iron is suddenly magnetized or demagnetized it will emit a feeble click. This sound is due, of course, to the adjusting and readjusting of the molecules of the piece of iron.

Specimens of Reis's apparatus are to be found in the Smithsonian Institution in Washington, D. C., and in semi-private museums in the United States.

Why do not these inventions transmit speech satisfactorily?

### CHARACTERISTICS OF SOUND.

A sound possesses three characteristics: Pitch, which depends upon the frequency of the vibrations; loudness, which depends upon the amplitude of the vibrations, and timbre, which depends upon the source of the sound. The tones of a piano and of a violin may be the same as to pitch and loudness, yet the tones are radically different. That difference is what I mean by timbre.

Reis's telephone will transmit pitch and loudness, but it cannot transmit timbre, because it operates on the *make and break* principle.

In the summer of 1874, Alexander Graham Bell conceived an apparatus that possessed the power of transmitting speech sounds by means of a self-generated *unbroken undulating current*, and on June 2, 1875, satisfactorily tested this apparatus. The device consisted essentially of a diaphragm of gold-beater's skin, which, when vibrated by the voice, set into similar vibration a steel armature mounted in association with an electromagnet. This motion of the armature generated an *unbroken undulating current* in the telephone circuit, in accordance with a principle discovered by the Russian scientist, E. Lenz, in 1834, and a principle discovered by the German scientist, F. E. Newmann, in 1845. These principles may be combined in a single sentence, as follows: Any change in the magnetic field, with respect to a conductor, induces a current in the conductor whose direction is such as to oppose the change which produced it, and the induced electromotive force is proportional to the rate of change of the field.

Bell's first receiver was an electromagnet with a vibrating steel reed armature. The attraction exerted by the electromagnet upon its armature varied exactly the same as the *unbroken undulating current* generated by the transmitting apparatus varied. Bell's apparatus transmitted and received timbre as well as pitch and loudness. For this reason Bell succeeded in transmitting intelligible speech while Reis failed.

### BELL'S FIRST PATENT.

Bell's first telephone patent, No. 174465, covered the use of an *unbroken undulating current* for the transmission of speech. It included the use of the alternating undulating current, which is produced by the device that I have just discussed, and the use of a uni-directional undulating current, which is produced by incorporating in the circuit a battery in association with a transmitter, the resistance of which is varied by the voice of the speaker. A second patent covered the use of a permanent magnet instead of an electromagnet.

Until March 7, 1893, and January 30, 1894 respectively, these patents controlled the manufacture of transmitters and receivers. No one challenged Bell's claim that he was the inventor of the telephone until the first patent was about eighteen months old. During the succeeding twenty years some fifty of the most eminent lawyers in the country tried to demolish Bell's claim and failed.

The world's production of raw cotton in 1920-21 is estimated at 19,595,000 bales of 500 lbs. gross, or 478 lbs. net, by the U. S. Dept. of Agriculture. United States, 13,366,000; India, 2,976,000; Egypt, 1,251,000; China, 1,000,000; Russia, 180,000; Brazil, 100,000; Mexico, 165,000; Peru, 157,000; and all other countries, 400,000 bales. A normal world crop is about 22,000,000 bales.

There are about 152,000,000 cotton spinning spindles in the world, of which 130,000,000 are actively at work, as a rule.

## WORLD'S WOOL PRODUCTION—MILLS IN UNITED STATES.

The world's production of wool averages about 2,600,000,000 pounds, of which 800,000,000 pounds comes from Australasia, 460,000,000 from South America, 200,000,000 from Russia, 225,000,000 from the U. S.

The number of woolen mills in the United States exceeds 1,000, and there are about 80,000 looms, over 8,000 of which are used in making carpets and rugs. The number of active spinning spindles exceeds 4,000,000, pretty evenly divided between woolens and worsteds. There are usually from 250,000 to 500,000 idle spindles.

## WORLD'S RAW SILK PRODUCTION.

The world's raw silk production in the 1921-1922 season is estimated at 59,437,000 lbs., of which Asia exported 48,740,000 lbs.

Raw silk production in the 1920-1921 season (pounds): Europe, 8,025,000 (Italy, 7,330,000; France, 551,000; Spain, 144,000); Levant, 1,654,000. Asia, 35,138,500 (China: Shanghai, 6,518,500; Canton, 4,210,000); Japan, 24,300,000; India, 110,000. Total for world, 44,817,500. Tussah silk, 1,650,000. Figures for Asia cover exports only. Actual production there last year was estimated as follows: China, 22,506,300 lbs.; Japan, 37,385,000 lbs.

## WORLD'S TOBACCO PRODUCTION.

Yearly average production (pounds)—Algeria, 23,000,000; Argentina, 35,000,000; Austria-Hungary, 170,000,000; Brazil, 100,000,000; Belgium, 20,000,000; Bulgaria, 30,000,000; Canada, 13,000,000; Ceylon, 25,000,000; Cuba, 75,000,000; China, 500,000,000; Chili, 9,000,000; Colombia, 20,000,000; Dutch E. Productive area includes arable land; natural meadows and pastures, nurseries and orchards; woods and forests, and marsh, heath and uncultivated productive land.

Arable land includes land used for cereals, grass and other fodder crops, food crops, industrial crops, crops for seeding purposes, bare fallow, fertilizer crops and fields under natural grass, and other and unspecified classification.

Changed boundaries in Austria, Bulgaria, Germany and Roumania partly account for differences in figures.

## THE FIVE GREAT FOOD GROUPS.

(Prepared by the U. S. Department of Agriculture.)

Every food may be put into one of five groups. Each of these groups serves a special purpose in nourishing the body. Some food from each group is needed regularly by the body.

1. Vegetables and fruits.
2. Meat, fish, eggs, milk, cheese, soy beans, and peanuts.
3. Cereal grains and their products.
4. Sweets—Sugar syrups, honey, jelly, and candies.
5. Fats and fat foods—Butter, cooking fats, and table oils; suet, salt pork and bacon; nuts.

1. *Vegetables and fruits* furnish some of the material from which the body is made and keep its many parts working smoothly. They help to prevent constipation.

2. *Meat, fish, eggs, milk, cheese, soy beans, and peanuts* help to build up the growing body and renew used-up parts. That is their main business, though they also serve as fuel. Milk is important for children.

3. *Cereals, and the flours, meals, breads, cakes, breakfast foods, and other dishes made from them* act as fuel for the work of the body, much as the gasoline burning in an automobile engine makes the car go. This is their chief business. Moreover they give the body some building material.

4. *Sweets*, too, are fuel. They also give flavor to other foods. They are valuable food, but many persons eat more of them than they need, and one could get along better without this group than without any of the others. Sweet fruits, especially dried ones like dates and raisins, contain much sugar and are better for the children than candy.

5. *Fats.* These furnish body-fuel in a concentrated form. Some are needed especially by hard-working people. Expensive fats are no better fuel than cheap ones. Drippings from bacon and other left-over fats can well be used. Children need some butter fat.

## HUNDRED-CALORIE PORTIONS IN COMMON FOOD MATERIALS.

The fuel value of food is measured in calories just as length is measured in inches. For convenience in meal planning, the hundred-calorie portion is sometimes used, as is done in the following table:

## WEEKLY NEEDS OF A FAMILY.

The number of hundred-calorie portions needed by any family can be estimated by reference to the table given below. For illustration, if a family consists of one man who does little muscular work; two women, one of whom does little muscular work, the other hard muscular work, an active boy 16 years of age, and three children, 11, 8, and 4 years of age, they would require, respectively, about 200, 150, 200, 280, 140, 120, and 100 hundred-calorie portions a week, which make a total of about 1,200 hundred-calorie portions per week.

## ENERGY NEEDS OF DIFFERENT INDIVIDUALS.

(Hundred-Calorie Portions.)

| INDIVIDUAL. | Per Day | Per Wk. | INDIVIDUAL. | Per Day | Per Wk. |
|---|---|---|---|---|---|
| A man or boy using much muscular energy in work or play up to | 40 | 280 | A boy or girl between 10 and 12 years of age, at least | 20 | 140 |
| A man or boy using little or no muscular energy in work or play | 27 | 200 | A boy or girl between 6 and 9 years of age, at least | 17 | 120 |
| A woman or girl using much muscular energy in work or play | 27 | 200 | A boy or girl between 2 and 5 years of age, at least | 14 | 100 |
| A woman or girl using little or no muscular energy in work or play | 22 | 150 | | | |

The diet will usually prove adequate and appetizing if the necessary calories of energy are supplied somewhat as follows:

About one-fifth by fruits and vegetables.
About one-fifth by meat, milk, and similar foods.
About three-tenths by cereal foods.
About one-tenth by sugar and other sweets.
About one-fifth by fats and fat foods.

## COAL RESERVES OF THE WORLD UNMINED.

UNITED STATES and Alaska, 3,538,506,328,300 tons, of which 16,153,000,000 tons is anthracite. 2,155,000,000,000 tons is bituminous, and 2,054,000,000,000 tons is sub-bituminous and lignite; Canada, 1,361,000,000,000 tons, of which 2,000,000,000 is anthracite and 313,000,000,000 is bituminous; China, 1,097,000,000,000 tons, of which 427,000,000,000 in anthracite; Germany, 467,000,000,000 tons, of which 452,000,000,000 tons is bituminous and the rest sub-bituminous; Great Britain, 209,000,000,000 tons, of which 12,000,000,000 is anthracite; Siberia, 192,000,000,000 tons, no anthracite; Australia, 183,000,000,000 tons, all bituminous or sub-bituminous; India, 87,000,000,000 tons, no anthracite; Russia in Europe, 66,000,000,000 tons, of which 41,000,000 is anthracite; Union of South Africa, 62,000,000,000 tons, of which 13,000,000,000 is anthracite; Austria, 59,000,000,000 tons, ne anthracite; Colombia, 30,000,000,000 tons, no anthracite; Indo-China, 22,000,000,000 tons, all anthracite; France, 19,000,000,000 tons, of which 4,000,000,000 is anthracite; Belgium, 12,000,000,000 tons, no anthracite; Spain, 10,000,000,000 tons, of which 2,000,000,000 is anthracite; Spitzbergen, 9,000,000,000 tons, no anthracite; Japan, 9,000,000,000 tons, no anthracite; Holland, 5,000,000,000 tons, no anthracite; other countries, 24,009,000,000 tons, of which 3,000,000,000 is anthracite.

Total coal reserves, 7,460,506,000,000 tons, of which 542,103,000,000 is anthracite.

Coal unmined in Pennsylvania is estimated at 16,000,000,000 tons anthracite and 108,474,000,000 tons bituminous; in West Virginia, 150,363,600,000 tons, bituminous.

### COAL OUTPUT OF THE WORLD.

The yearly coal production of the world is estimated at slightly under 1,500,000,000 short tons, of which from 550,000,000 to 650,000,000 tons is mined in the United States; 325,000,000 in Great Britain; 300,000,000 in old Germany; 66,000,000 in old Austria-Hungary; 50,000,000 in old France; 40,000,000 in old Russia; 25,000,000 in Belgium; 30,000,000 in Japan; 20,000,000 in China; 20,000,000 in India; 15,000,000 in Canada; 12,000,000 in New South Wales; 7,000,000 in Spain; 10,000,000 in Union of South Africa; 2,500,000 in New Zealand; and smaller amounts in Holland, Chile, Mexico, Turkey, Italy, Sweden, Serbia, Bulgaria, Peru and other countries.

### COAL MINERS—THEIR AVERAGE NUMBER.

The number of men employed in the Pennsylvania anthracite mines ranged as high as 180,000 in 1914, and as low as 154,000 in 1917. They average 200 (1908) to 293 (1918) days' work a year, and they dig 2.02 (1913) to 2.39 (1908) tons per man per day.

In the bituminous mines the number of employees ranged up to 615,305 in 1918, with 243 days' work per year, and an average digging of 3.91 (1915) tons per man per day.

### WORLD'S IRON AND STEEL PRODUCTION.

(Long or metric tons of 2,240 lbs.)

Pig iron (1913) 65,566,000; (1919) 46,690,000; (1920) 54,976,000; (1921) 29,281,000.

Steel (1913) 63,356,000; (1919) 51,774,000; (1920) 63,117,000; (1921) 35,342,000.

The "minette' ore field, which extends over a portion of Alsace-Lorraine, Luxemburg, and Belgium, is the most important as regards quantity in Europe. This field in 1912 produced 44,000,000 tons, or 28 per cent. of the world's output. The ore—geologically a bedded oolitic ironstone of Jurassic age—is a carbonate partly oxidized to brown ore,

### IRON ORE RESOURCES OF THE WORLD.

The unmined iron ores of the world are officially estimated as follows, in metric or long tons:

Nearly 76 per cent. of planted acreage plantation rubber is owned by British capital, and 5.6 per cent. by American capital, according to best available authorities.

The 55,000 acres planted and controlled by American capital comprise the estate of the General Rubber Co., in Sumatra. American interests have also acquired 40,000 acres of undeveloped land in Sumatra. A very limited area is also planted to rubber in Mindanao Philippines.

The death rates for typhoid, measles, scarlet fever, whooping cough and diphtheria are, generally speaking, higher in foreign than in American cities.

## VITAL STATISTICS FOR ENGLAND AND WALES, 1920.

The important facts in the record of vital statistics for England and Wales for the year 1920, as presented in the Eighty-third Annual Report of the Registrar for England and Wales for that year, are stated to be the following: The highest marriage rate recorded to that date—20.2 per 1,000 of the population, a rate 4.8 above the average of the last 10-year period unaffected by the war (1905-1914); the highest birth rate (25.5 per 1,000 population) since 1909; and the lowest death rate recorded, namely 12.4 per 1,000 population, being 1.3 below the rate for 1919. The number of deaths was 466,130—the smallest number recorded in any year since 1862, when the population was little more than half that of 1920.

The proportion of males to females born in 1920 was 1,052 per 1,000, continuing much above pre-war experience. The loss of births attributable to the war was estimated at about 600,000.

## MARRIAGE, BIRTH AND DEATH RATES IN GERMANY.

The Statistische Reichsamt has recently published the marriage, birth and death rates in Germany for 1921, and comparisons are made with the figures for the years 1904-1920. The following table gives the data for the years 1904 to 1921, inclusive, and the difference between the birth rates and death rates for each year:

*Marriage, birth, and death rates per 1,000 population in Germany, 1904 to 1921, inclusive.*

| Year. | Marriage Rate. | Birth Rate. | Death Rate. | Differ-ence. | Year. | Marriage Rate. | Birth Rate. | Death Rate. | Differ-ence. |
|---|---|---|---|---|---|---|---|---|---|
| 1904 | 8.0 | 35.1 | 20.6 | +14.5 | 1913 | 7.7 | 28.3 | 15.8 | +12.5 |
| 1905 | 8.1 | 34.0 | 20.8 | +13.2 | 1914 | 6.8 | 27.6 | 19.9 | + 7.7 |
| 1906 | 8.2 | 34.1 | 19.2 | +14.9 | 1915 | 4.1 | 21.0 | 22.0 | — 1.0 |
| 1907 | 8.1 | 33.2 | 19.0 | +14.2 | 1916 | 4.1 | 15.7 | 19.7 | — 4.0 |
| 1908 | 8.0 | 33.0 | 19.0 | +14.0 | 1917 | 4.7 | 14.4 | 20.8 | — 6.4 |
| 1909 | 7.8 | 32.0 | 18.1 | +13.9 | 1918 | 5.4 | 14.7 | 18.8 | — 4.1 |
| 1910 | 7.7 | 30.7 | 17.1 | +13.6 | 1919 | 13.4 | 20.6 | 16.1 | + 4.5 |
| 1911 | 7.8 | 29.5 | 18.2 | +11.3 | 1920 | 14.8 | 27.1 | 16.3 | +10.8 |
| 1912 | 7.9 | 29.1 | 16.4 | +12.7 | 1921 | 11.9 | 26.1 | 14.8 | +11.3 |

Positive figures indicate excess of births over deaths; minus figures excess of deaths over births.

The figures in the following table represent the marriages, births, and deaths in 1920 and 1921 as compared with 1913, the figures for 1913 being taken as a base and represented as 100:

*Marriages, births, and deaths in Germany in 1920 and 1921 as compared with 1913.*

## POISONS AND THEIR ANTIDOTES.

NOTE—When the poison is unknown, give stimulants and soothing liquids. The data below is from an American National Red Cross textbook on first aid.

*Table I.—Poisons for which an emetic is always given first.*

The treatment is in addition to an emetic.

ALCOHOL—In any form—rum, gin, whiskey, proof spirits, etc., also methyl alcohol.

*Symptoms*—Giddiness, swaying of body, inability to stand. Face flushed, eyes red, skin clammy, weak pulse, may be convulsions and unconsciousness.

*Treatment*—Hot coffee or aromatic spirits of ammonia. Try to arouse, but if weak do not exhaust by making walk. Dash cold water on face and chest. When somewhat recovered, wrap warmly and put to bed.

ARSENIC—Found in rat poisons, vermin killer, Paris green, Fowler's solution. Sometimes in tinned fruits and beer.

*Symptoms*—Severe pain in stomach; purging; severe cramps in legs, vomiting, dryness of throat, cold sweats, profound shock.

*Treatment*—Much lukewarm water. Magnesia in large quantity or dialyzed iron in ½-ounce doses, repeated. Beaten-up eggs or castor oil and stimulants. Warmth and rubbing. If rat poison has been taken, treat as for poisoning by arsenic.

CARBON MONOXIDE—It is in blast and coke furnaces and foundries; in leaky furnaces or chimneys; about gas stoves without flue connections, such as tenements, tailor shops or boarding houses. The exhaust gases of gasoline automobiles contain from 4 to 12 per cent. of carbon monoxide, and in closed garages men are not infrequently found dead beside a running motor. A similar danger may arise from gasoline engines in launches. The gas is formed also in stoke-rooms, in gun turrets on battleships, in petroleum refineries, and in the Leblanc soda process in cement and brick plants. In underground work it may appear as the result of shot firing, mine explosions, or mine fires, or in tunnels from automobile exhausts or from coal or oil burning locomotives.

*Symptoms*—Carbon monoxide exerts its extremely dangerous action on the body by displacing oxygen from its combination with hemoglobin, the coloring matter of the blood which normally absorbs oxygen from the air in the lungs and delivers it to the different tissues of the body.

*Treatment*—1. Administer oxygen as quickly as possible and in as pure form as is obtainable, preferably from a cylinder of oxygen through an inhaler mask. 2. Remove patient from atmosphere containing carbon monoxide. 3. If breathing is feeble, at once start artificial respiration by the prone posture method. 4. Keep the victim flat, quiet, and warm. 5. Afterward, give plenty of rest.

LEAD—Sugar of lead, lead paint, white lead.

*Symptoms*—Throat dry; metallic taste with much thirst, colic in abdomen, cramps in legs, cold sweat; sometimes paralysis of legs and convulsions.

*Treatment*—½-ounce Epsom salts in tumbler of water. Stimulants and soothing liquids.

OPIUM—Laudanum, morphine, paregoric, some soothing syrups and cough mixtures.

*Symptoms*—Drowsiness, finally unconsciousness; pulse full at first, then weak; breathing full and slow at first, gradually slower and shallow; pinhead pupils; face flushed, then purple.

*Treatment*—May have difficulty in getting emetic to work; plenty of strong coffee. Try to arouse by speaking loudly and threatening, but do not exhaust by compelling to walk, etc. Stimulants and artificial respiration.

PHOSPHORUS—In matches, phosphorous paste in many rat poisons and vermin killers, often with arsenic.

*Symptoms*—Severe pain in stomach, vomiting. Skin is dark and may have odor of phosphorus. Bleeding from nose; bloody purging. Convulsions.

*Treatment*—Epsom salts, ½-ounce in tumbler of water, or magnesia. Stimulants. Soothing liquid best. Milk. Avoid fats and oils.

PTOMAINE—Poisoning by decayed meat, fish, milk, or ice cream.

*Symptoms*—Nausea, vomiting, purging. Skin cold and clammy. Pulse weak. Severe pain in abdomen, cramps, great prostration and weakness. Often eruption on skin.

*Treatment*—Purgative, castor oil or Epsom salts. Teaspoonful of powdered charcoal, and repeat

STRYCHNINE—NUX VOMICA—Strychnine is frequently used on meat to poison animals, and in some vermin killers.

*Symptoms*—Convulsions, very severe, alternating with cramps, affecting all muscles of body. Back is bowed up by spasms of muscles. Jaws are locked. Spasm of muscles is so great that it prevents breathing, so face becomes dusky.

*Treatment*—Powdered charcoal, if possible, in large quantity. Follow with another emetic. Absolute quiet so as not to bring on convulsions.

*Table II.—Poisons for which an emetic should not be given first.*

MERCURY—Corrosive sublimate, antiseptic tablets. Other salts of mercury much less commonly used.

*Symptoms*—Corrosive sublimate is very irritating, so when taken turns mouth, lips and tongue white. Mouth is swollen and tongue is shrivelled; always metallic taste in mouth. Pain in abdomen. Nausea and vomiting mucus and blood, bloody purging, cold, clammy skin, great prostration, and convulsions.

*Treatment*—First, give white of egg or whole egg beaten up; flour and water, but not so good. Emetics, soothing liquids, and stimulants.

NITRATE OF SILVER—Lunar caustic.

*Symptoms*—Pain in mouth and stomach; mouth first colored white, then black; vomit first white, then turns black.

*Treatment*—Common salt dissolved in water, or milk very frequently. Then emetic. Afterward soothing liquids and stimulants.

*Table III.—Poisons for which an emetic should never be given.*

STRONG CORROSIVE ACIDS—1. Acetic; 2, Hydrochloric (spirits of salt); 3, Nitric (aqua fortis); 4, Sulphuric (vitriol.)

*Symptoms*—Very severe burning pain in mouth, throat, and stomach. Wherever acid touches skin or mucous membrane they are destroyed. Frequently vomiting and purging. More or less suffocation from swelling of throat, great prostration and shock.

*Treatment*—An alkali to neutralize acid. Best, magnesia or chalk in water, given frequently and freely. Lime, whiting, baking soda, plaster, tooth powder, or even wood ashes may all be used for alkali, or ammonia, a tablespoonful to 2 cups of water, but those mentioned above are better as they are less irritating. Afterward, soothing liquids, milk, milk and egg, olive oil. Stimulants are practically always required. If acid has entered air passage, may inhale fumes of ammonia.

OXALIC ACID (salts of lemon or sorrel)

*Symptoms*—Much like corrosive acids just named, but not so much burning of lips, etc.

*Treatment*.—Magnesia, chalk, and water or lime water to neutralize acid. Then one ounce of castor oil and stimulants freely.

CARBOLIC ACID (Phenol)—(Very commonly used in attempts at suicide.)

*Symptoms*—It is also a powerful corrosive poison, which causes great pain and vomiting. Severe case: Unconsciousness very soon and early death. Usually easy to tell by odor of acid and burn, which with pure acid is white and with impure, black.

*Treatment*—Rinse mouth with pure alcohol. If grown person, should swallow three or four tablespoonfuls of alcohol mixed with an equal quantity of water. Follow this in five minutes with two tablespoonfuls of Epsom salts dissolved in a little water. Though not so good, limewater may be used to rinse mouth, several glasses of it being swallowed; three or four raw eggs may be given or castor or sweet oil. Stimulants always, and keep warm.

STRONG CAUSTIC ALKALIES: 1, Ammonia: Strong ammonia, ammonia liniment, camphor liniment; 2, Lime: Quicklime; 3, Potash: Caustic potash; 4, Soda: Caustic soda.

*Symptoms*—Much like corrosive acids. Immediate severe burning, pain in mouth, throat, and stomach. Vomiting and purging. Alkali destroys tissues of mouth it has touched. Severe shock and suffocation from swelling.

*Treatment*—An acid to neutralize alkali. Vinegar, lemon or orange juice. Tartaric or citric acid in plenty of water. Soothing liquids. stimulants. If cannot swallow, may inhale acetic acid or vinegar from a pocket handkerchief.

*CAUTION. In giving any antidote do not wait for it to dissolve but stir it up in any fluid which can be obtained, except oil, and give it at once.*

## HELP IN CASE OF ACCIDENTS.

**Drowning.** There are several methods of artificial respiration, but the Schaefer prone-pressure one-man method is considered the best, being widely used throughout the United States as well as in many foreign countries. By the plan many human lives are saved each year by members of the U. S. Vol. Life Sav. Corps, who use it to the exclusion of all others. The directions are as follows;

Send some one immediately for a doctor. DO NOT AWAIT HIS ARRIVAL, but proceed as follows: After the patient has been taken from the water locate an even flat surface, laying the patient face downward. Loosen all clothing, collars, belts, garters, etc. Clear the mouth of all mucus and foreign matter, pull the tongue out and see that it remains out; then straddle the patient, placing your hands under his stomach, clasping them together. In this manner gradually lift the patient a few inches, squeezing as you do so, dropping him suddenly. Sometimes a sharp slap between the shoulders is helpful. Lifting the patient as above mentioned should only be done once or twice, taking a few seconds, as it is merely to start anything that might be blocking the air passages.

Remind some one in the crowd about the doctor. Keep the patient lying face downward on an even flat surface, arms extended, the forehead resting on the leeward forearm, tongue out, facing the wind, the windward arm to be crooked, acting as a protector to the face. Straddle the patient as before, facing his head place your hands, open spread, upon the patient's lower or short ribs, commencing with a downward and inward pressure to the count of three, relaxing to the same count. This motion is continuous, first down, then up, swinging the body to and fro to the count of three. After the downward pressure to the count of three the hands are relaxed from the ribs to the same count each time, and should be maintained until signs of life show—namely, when the patient breathes unaided.

For warmth and circulation, rub the arms and legs upward (toward the heart), no back strokes. Circulation should not be started until after breathing has been fully restored. During the period of operation the subject should be kept warm by the application of hot water bottles, heated bricks, etc. applied to the pit of the stomach, the armpits, between the thighs or to the soles of the feet. Should you not be able to resort to these suggestions as to warmth, a fire built on the lee side of the patient at a distance not to set fire to him would help serve the purpose. Stimulants should not be given by the mouth until after the patient is able to swallow—that is, when the patient is fully conscious, then give plain black coffee, or half teaspoonful of aromatic spirits of ammonia in half a glass of water.

The patient should be kept in bed as quiet as possible in a well ventilated room. To be feared: Pneumonia or possible collapse of the heart.

This treatment should be continued at least an hour. As a general rule signs of life begin to show after 8 or 10 minutes' work. One should not be discouraged if it takes longer, as life has been restored after working as long as 30 minutes, although this is not common.

We read of persons having been revived after being under water as long as 15 minutes. This is very rare. If the person has been under water 3 or 4 minutes there is everything in his favor, but should the submersion be much longer the odds are apt to be against it. In any case never give up, but commence work at once.

Signs of death are: Breathing and the heart's action entirely cease, eyelids generally are half closed, the pupils dilated, the tongue approaches the under edges of the lips, and these, as well as the nostrils, are covered with a frothy mucus. Coldness and pallor of surface increase.

Remember that mechanical devices are dangerous in the hands of the inexperienced.

Do not await the arrival of the doctor before starting the artificial respiration. Start immediately.

Do not lay the patient on the back when applying artificial respiration. Always face downward.

Do not hold the body up by the feet.

Do not dash water in the patient's face.

Do not place the body in a bath unless ordered to do so by the doctor.

Do not tie strings on the tongue or run pins or nails through it.

Do not roll the patient over barrels, boxes, or a fence.

**Burns and Scalds.** Cover with cooking soda and lay wet cloths over it. Whites of eggs and olive oil. Olive oil or linseed oil, plain or mixed with chalk or whiting. Sweet or olive oil and lime water.

**Lightning.** Dash cold water over a person struck.

**Sunstroke.** Loosen clothing. Get patient into shade and apply ice-cold water to head. Keep head in elevated position.

**Mad Dog or Snake Bite.** Tie cord tight above wound. Suck the wound and cauterize with caustic or white-hot iron at once, or cut out adjoining parts with a sharp knife. Give stimulants, as whiskey, brandy, etc.

**Stings of Venomous Insects, etc.** Apply weak ammonia, oil, salt water, or iodine.

**Fainting.** Place flat on back; allow fresh air and sprinkle with water. Place head lower than rest of body.

## COMMON STAINS AND HOW TO REMOVE THEM.

(By the U. S. Department of Agriculture.)

Blood and meat juice. Use cold water; soap and cold water; or starch paste.

Bluing. Use boiling water.

Chocolate and cocoa. Use borax and cold water; bleach if necessary.

Coffee and tea. (Clear.) Use boiling water; bleach if necessary. (With cream.) Use cold water, then boiling water, bleach if necessary.

Coffee and tea. (Clear.) Use boiling water; bleach if necessary. (With cream.) Use cold water, then boiling water; bleach if necessary.

Cream and milk. Use cold water, then soap and cold water.

Egg. Use cold water.

Fruit and fruit juices. Use boiling water; bleach if necessary.

Grass. Use cold water; soap and cold water; alcohol; or a bleaching agent.

Grease and oils. Use French chalk, blotting paper or other absorbent; or warm water and soap; or gasoline, benzine, or carbon tetrachloride.

Iodine. Use warm water and soap; alcohol; or ammonia.

Ink. Try cold water; then use an acid or bleach if necessary.

Iron. Use oxalic acid; hydrochloric acid; salts of lemon; or lemon juice and salt.

Kerosene. Use warm water and soap.

Lampblack and soot. Use kerosene, benzine, chloroform, ether, gasoline, or carbon tetrachloride.

Medicine. Use alcohol.

Mildew. If fresh, use cold water; otherwise try to bleach with Javelle water or potassium permanganate.

Paint and varnish. Use alcohol, carbon tetrachloride, chloroform, or turpentine.

Perspiration. Use soap and warm water; bleach in the sun or with Javelle water or potassium permanganate

Pitch, tar, and wheel grease. Rub with fat; then use soap and warm water; or benzine, gasoline, or carbon tetrachloride.

Scorch. Bleach in the sunshine or with Javelle water.

Shoe polish. (Black.) Use soap and water; or turpentine. (Tan.) Use alcohol.

Syrup. Use water.

Stove polish. Use cold water and soap; or kerosene, benzine, or gasoline.

Vaseline. Use kerosene or turpentine.

Water. Steam or sponge the entire surface of water-spotted materials.

Wax. Scrape off as much as possible. Use French chalk, blotting paper or other absorbent with a warm iron; or use benzine or gasoline. If color remains, use alcohol or bleach.

# Sporting Events and Records.

Amateur and professional sports throughout the United States continued to grow in interest both from the spectator's and competitor's basis during the season of 1922. Reports from every section of the country showed a steady development and spread in all forms of games and sport and attendant enthusiasm therein. New gate receipt records were made in the World's Baseball Series and major and minor leagues reported unusually large gate receipts during the pennant seasons.

National golf and tennis tournaments drew record-breaking galleries, and football games in all portions of the country, especially those with intersectional interest, filled huge stadiums to overflowing. Classic races of the turf season brought thousands of racing enthusiasts to the scene of various derbies and stake events. Boxing bouts of titular calibre proved remarkably profitable to both contestants and promoters.

Competition was both brilliant and sensational in almost every branch of sport. A host of new records was made by American swimmers, male and female. A number of international track and field records were broken by college and club athletes.

While the Davis Cup, emblematic of the world's team tennis championship, was the only famous international trophy in competition, there was no lack of international competition. American golfers took part in Great Britain's championships and the British players competed in the United States title play later in the year. British yachtsmen entered a team in the international six-metre races on Long Island Sound and English, Irish and Argentine polo fours played in the national polo tournament.

## BASEBALL.

Ball playing was popular in Egypt 4,000 years ago, and a leather ball has been used ever since in almost every country, including China, but batting the ball is a modern innovation. According to the commission, appointed at A. G. Spalding's suggestion in 1907, baseball originated in the United States, and the first scheme for playing it was devised by Major Gen. Abner Doubleday, in 1839, at Cooperstown, N. Y. The game was developed from Town Ball into a diamond-shaped field, and a code of playing rules was adopted by the Knickerbocker Base Ball Club of New York, in 1845. In 1858 the National Association of Base Ball Players was formed, and the first game with an admission fee was played July 20, at the Fashion Race Course, near Jamaica, L. I., between the New York and Brooklyn clubs. The first tour of an organized club was made through New York State, in 1860, by the Excelsiors of Brooklyn. The first Eastern club to tour the West was the National, of Washington, D. C. The first professional baseball club (1869) was the Cincinnati (Red Stockings), formed in 1866 as an amateur organization. The National Association of Professional Base Ball Players was formed in 1871 (with 10 clubs); the National League of Professional Base Ball Clubs, in 1876; the American Association, in 1882; the American League, in 1902.

The World's Series of 1922 was played between the New York National League and the New York American League Clubs, respective pennant winners in their leagues. All games were played at the Polo Grounds, New York City, the National League Club (Giants) won in four games to none, with the second contest ending in a 3-3 tie due to darkness. Prominent betting Commissioners ruled that where a wager was made that one team would win four straight games, those who bet on Giants won, the tie game not counting against the sequence of victories. ## HOME RUN RECORDS.

Although "Babe" Ruth, of the New York Americans did not approach his 1921 record of 59 home runs, due in part to suspensions and other causes, the 1922 season was notable for the number of home runs made in the major leagues. The records of some of the leading hitters in this department of the game follow:

## ROWING.

### YALE VS. HARVARD—VARSITY EIGHTS.

YALE and Harvard varsity eight-oared races began in 1852 on Lake Winnepesaukee, at two miles, when Harvard won. In 1855 the course was changed to Springfield and lengthened to three miles. Lake Quinsigamond was the scene for nine years, and Lake Saltonsall for 1869. After an interval of seven years the crews in 1876-77 went to Springfield, Mass., when the four-mile course was inaugurated. In 1878 the crews changed again to New London, Conn. The official records follow:

## MOTOR BOAT RACING.

Until 1921 the Gold Cup Trophy was for boats under 40 feet in length, with unlimited power. Very costly racing machines were developed under those rules. Under the new rules the boats must be under 26 feet in length and the cubic capacity of the engine is limited to 625 cubic inches. Such engines average 100 horse power, and the average speed of a boat is not much over 40 miles an hour, as against 70 miles an hour under the old rules.

There were no races for the Harmsworth Trophy, emblematic of the world's speed championship, in 1922. The National Gold Cup Trophy race, held at Detroit, Sept. 1–4, was the leading event of the season. Result:

## PUGILISTIC CHAMPIONS.

All attempts to designate and classify the pugilistic champions and title holders are more or less arbitrary because of the fact that few such champions won and defended the championships at the same weight. Among the lighter weight boxers it is not at all unusual for a pugilist to be forced from one class into the next higher by growth and increased weight. The following list, dating from 1890, is generally accepted by critics and boxers as being the correct classification, although holders did not always win title from previous champions:

HEAVYWEIGHTS (over 158 lbs.)—1890-1892, John L. Sullivan; 1892-1897, James J. Corbett; 1897-1899, Robert Fitzsimmons; 1899-1906, James J. Jeffries; 1906-1908, Tommy Burns; 1908-1915, Jack Johnson; 1915-1918, Jess Willard; 1919-1922, Jack Dempsey.

MIDDLEWEIGHTS (158 lbs.)—1890-1897, Robert Fitzsimmons; 1897-1907, Tommy Ryan; 1907-1908, Stanley Ketchel; 1908, Bill Papke and Stanley Ketchel; 1908-1910, Stanley Ketchel; 1911-1913, claimed by Frank Klaus, Mike Gibbons, Ed McGoorty and Geo. Chip; 1914-1917, Al McCoy; 1917-1920, Mike O'Dowd; 1921-1922, Johnny Wilson.

WELTERWEIGHTS (145 lbs.)—1890-1893, no recognized champion; 1894-1896, Tommy Ryan; 1896-1897, Kid McCoy; 1898-1900, Billy Smith; 1900, Rube Ferns; 1901, Matty Matthews and Rube Ferns; 1901-1904, Joe Walcott; 1904-1908, Dixie Kid; 1914-1916, Kid Graves; 1916, Jack Britton; 1917-1918, Ted (Kid) Lewis; 1919-1922, Jack Britton, Mickey Walker.

LIGHTWEIGHTS (133 lbs.)—1890-1893, Jack McAuliffe; 1893-1899, Kid Lavigne; 1899-1902, Frank Erne; 1902-1908, Joe Gans; 1908-1910, Battling Nelson; 1910-1912, Ad Wolgast; 1912-1914, Willie Ritchie; 1914-1917, Freddie Welsh; 1917-1922, Benny Leonard.

FEATHERWEIGHTS (122 lbs.)—1890-1892, no recognized champion; 1892-1897, George Dixon; 1897, Solly Smith; 1898, Solly Smith and Dave Sullivan; 1898-1900, George Dixon; 1900-1901, Terry McGovern; 1901-1904, Young Corbett; 1904-1908, Tommy Sullivan; 1908-1911 Abe Attell; 1911-1922, Johnny Kilbane.

BANTAMWEIGHTS (116 lbs.)—1890-1892, George Dixon; 1892-1894, no recognized champion; 1894-1898, Jimmy Barry; 1898-1901, no recognized champion; 1901-1903, Harry Forbes; 1903-1905, Frankie Neil; 1905-1907, no recognized champion; 1907-1913, Johnny Coulon; 1914-1915, Kid Williams; 1916-1920, Pete Herman; 1920-1921, Joe Lynch; 1921, Pete Herman, Johnny Buff; 1922, Johnny Buff, Joe Lynch.

Norman Seagram's Canadian tour in England, won 0, lost 4, drawn 7.

Frankford Cricket Club won the Halifax Cup, New York being represented by Staten Island, this being the first time the Staten Island Club took part in the competition. J. L. Evans of the Merion Club won the batting average and R. Waad of the Frankford Club the bowling average.

Yorkshire won the English county championship in 1922.

The highest individual scores of the season were hit by J. L. Evans, 135 not out, in the United States and P. P. Barnett, 184 not out, in Canada.

H. Livingston of the Pittsburgh Field Club established a record for the United States by scoring three consecutive centuries in one week in a tournament held in Chicago in August, 1907; a similar feat was performed by H. N. R. Coblet in Canada in a tournament held in Vancouver, British Columbia, in August, 1906. H. V. Hordern of the University of Pennsylvania established a record for the United States and Canada by securing 213 wickets during 1907. J. B. King, F. F. Kelly and H. Rushton are the only three bowlers who have taken over 2,000 wickets. A. C. MacLaren scored 424 for Lancashire vs. Somerset at Taunton, England, July, 1895—the record in a first-class match. A. F. J. Collins, playing at Clifton, June, 1899, for Clarke's House against North Town, scored 628, not out—the record in any match. Melbourne University scored 1,094 runs against Essenden at Melbourne (Australia), 1898—the highest authenticated record. In a match between A. E. Stoddart's English team and New South Wales, 1,739 runs were scored—a record in first-class cricket. The longest partnership on record was 623 runs by Capt. Oakes and Private Fitzgerald, First Royal Munster Fusiliers vs. Army Service Corps, at Curragh, 1895. In a small match in Australia F. R. Spofforth bowled down all 10 wickets of his opponents in each inning—a feat without parallel. F. R. Spofforth on the Australian tour in 1878 took 764 wickets—a world's record. Dr. W. G. Grace, the world's greatest cricketer, died Oct. 23, 1915. He hit up 217 centuries during his career, which will not likely ever be equalled.

Best records in the United States and Canada are by G. S. Patterson eleven playing against A. M. Woods eleven at Philadelphia, scoring 689 runs, in 1894. Australians against Vancouver scored 633 for 8 wickets in 1913. J. B. King scored 344 runs for Belmont against Merion B. in 1906. W. Robertson, 206, not out, and A. G. Sheath, 118, not out, scored 340 runs in partnership, without the loss of a wicket, at San Francisco in 1894. Smallest score, Americas 0 against Roseville at Guttenberg, N. J., in 1897. NOTE. The Derby of 1915-6-7-8 was run at Newmarket as the "New" Derby. The 1920 Derby was won in record time of 2 minutes 34 4-5 seconds; previous best time being Lemberg's, 1910, 2 minutes 35 1-5 seconds.

The 1921 Derby was run on June 1. Humorist at 12 to 1 in the betting, won in a hard drive by a neck from Viscount Astor's Craig an Eran, while three lengths back Joseph Watson's Lemonora finished third, and Allen Breck, the favorite, fourth. A. K. Macomber's The Bohemian, an American bred horse was never prominent and finished among the also rans. The time was 2 minutes, 45 seconds. The King and Queen were present.

### THE 1922 DERBY.

The 1922 Derby was won in a canter in the record time of 2 minutes, 34 3-5 seconds. Tamar, owned by Lord Astor, was second; Craigangower, third; and the betting favorite, St. Louis, fourth.

The Derby was instituted by the twelfth Earl of Derby in 1780. A year earlier the same racing peer had started the Oaks, named after his place at Banstead Downs—the Valley of Lambert's Oaks. Lord Derby won his own race in 1787 with Sir Peter Teazle, named thus in honor of his wife, who was Miss Farren, and had been acting as Lady Teazle in "The School for Scandal," when Lord Derby saw her for the first time. On May 18, 1847, Lord George Bentinck moved the adjournment of the House of Commons over Derby Day. This motion was moved each year until 1879.

The Derby course on Epsom Downs is left-handed, and consists of two straights and a turn—the historic Tottenham Corner.

### 1922 CALCUTTA SWEEPSTAKES.

The winner of the Calcutta sweepstakes, a Liverpool woman, Miss Gwendoline Thomas, thirty-four, is the sole support of her widowed mother.

Miss Thomas would have won £122,000 but she sold half her ticket for £3,000 to a Calcutta man. Her winnings, therefore, amount to £64,000 and are free from income tax, as the authorities do not recognize income from such a source.

## FOOTBALL.

Intercollegiate football developed marvellous popularity in 1922, record throngs attending many big games in all parts of the country and the largest stadiums were unable to accommodate all who desired to witness the play. The scores of a few of the leading college teams follow:

## LACROSSE.

Lacrosse gained further popularity as a college sport during the season of 1922, due in part to the tour of the Oxford-Cambridge University combination from England. The northern section championship of the Intercollegiate League was won by the Syracuse University team without a defeat. The southern section play resulted in a tie, the University of Pennsylvania team winning in the play-off. The record of the leading college twelves, including non-league games, follows:

| Team. | Won. | Lost. | Per Cent. |
|---|---|---|---|
| Syracuse | 17 | 0 | 1.000 |
| Navy | 7 | 0 | 1.000 |
| Maryland | 7 | 1 | .875 |
| Princeton | 6 | 2 | .750 |
| Army | 5 | 2 | .714 |
| Rutgers | 5 | 2 | .714 |
| Hopkins | 7 | 3 | .700 |
| Hobart | 5 | 3 | .625 |
| Cornell | 5 | 4 | .555 |
| Pennsylvania | 5 | 5 | .500 |
| Lehigh | 5 | 5 | .500 |

The Oxford-Cambridge combination played twelve games with the United States college teams for possession of the International Lacrosse Cup, winning seven and losing 5. The results follow:

## WOMEN'S ATHLETICS.

Athletics for women received a great impetus throughout the country during the season of 1922 when a team of schoolgirl athletes representing the United States competed in the first international meet held in Paris, August 20, and won second place. Development of track and field sports for women is progressing in all parts of the country and it is expected that the Amateur Athletic Union will assume jurisdiction of women's athletics in the United States before 1923 and that the country will be represented by a women's team in the Olympic Games of 1928 at Amsterdam when events for women are planned for the program at those games.

## ARCHERY.

The 42d Annual Championship Tournament of the National Archery Association of the United States, was held in Cooperstown, New York, August 22 to 25 and was known as "The Robin Hood Tournament." Chief among the new trophies was the Douglas Fairbanks' Robin Hood Trophy. Other new trophies were the Maid Marion Cup presented by Wallace Bryant of Washington, D. C., the Leatherstocking Cup presented by James Fenimore Cooper of Cooperstown, New York, and a cup also presented by Wallace Bryant for the best score at 80 yards.

Competition for the men's championship narrowed down to the 1921 champion, James S. Jiles of Pittsburgh, Pa. and Dr. Robert P. Elmer of Wayne, Pa., who had held the championship for a number of years previous to 1921. Dr. Elmer finally winning. Among the ladies Miss Dorothy D. Smith of Newton Center, Mass., was successful in defending her championship title.

In connection with Dr. Elmer's shooting he won the Double York Round with a score of 1,039. In two previous championship tournaments Dr. Elmer had made over 1,000 in the Double York Round, the present tournament being the third at which he had accomplished this feat. H. A. Ford, of England, is the only other archer who ever made over 1,000 in the Double York Round at three championship meets.

The only records which were broken were in the team shoots. The Robin Hood Team from the Wayne Archers, and composed of Dr. R. P. Elmer, W. H. Palmer Jr., J. M. Mauser and W. H. Palmer 3d, not only won the championship for the men's team shoot, but broke the previous record of 1,680 by making a total of 1,691. The ladies' team from the Newton Archers, of Newton, Mass., composed of Miss Dorothy D. Smith, Mrs. L. C. Smith, Miss Norma Pierce and Mrs. E. W. Frentz, also broke the women's team record of 1,517 by making a new score of 1,525.

A special contest for the Douglas Fairbanks' Robin Hood Trophy was staged, consisting of a long-range wand shoot. A band two inches wide was placed vertically across each target and the contestants each shot 48 arrows at a distance of 100 yards. Only the arrows which lodged in the narrow band counted. This event was won by Dr. R. P. Elmer with three hits in the band.

A special event was also staged for the Leatherstocking Cup. This event was participated in by both men and women, the men shooting 48 arrows at 60 yards and the women 48 arrows at 40 yards. The cup was won by W. H. Palmer Jr., of Wayne, Pa., with a total of 273 points. Miss Dorothy D. Smith was a close second with 266 points.

The winners in the various events are as follows:

## WORLD AND AMERICAN SWIMMING RECORDS.

World swimming records must be officially recognized by the International Amateur Swimming Federation. The Federation meets annually and records are frequently recognized a year or more after being made. Many American records made in 1922 are also world records as yet unsanctioned. American records are based upon short courses, from 60 feet to 220 yards, and long courses, from 220 feet to 220 yards.

## CENTRE OF NEGRO POPULATION, 1920.

The United States Department of Commerce announces that the centre of Negro population as determined by the Bureau of the Census on the basis of the fourteenth census enumeration, taken Jan. 1, 1920, is located in latitude 34°46'52" and longitude 85°30'48", being in the extreme northwestern corner of Georgia, in Dade County, about 1¾ miles north-northeast of Rising Fawn town, and that for the first time in the history of the country this centre has moved northeast, being approximately 9.4 miles further east and 19.4 miles further north in 1920 than it was in 1910.

Its former movements have all been in a southwesterly direction. In 1790 it was located 25 miles west-southwest of Petersburg, Dinwiddie County, Virginia, and one hundred years later, in 1890, it had moved southwest 463 miles to a point 15.7 miles southwest of Lafayette, Walker County, Georgia, the same county in which it was located in 1880.

Between 1890 and 1900 it crossed the State line into Alabama, its location in 1900 and again in 1910 being in DeKalb County, Alabama. Its northeastward movement after 1910 has brought it back to the State of Georgia.

The northeasterly movement of the centre of Negro population between 1910 and 1920 is due principally to the great increase in the Negro population of Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, West Virginia, Ohio, Indiana, and Michigan.

The total increase in the Negro population of the United States was 635,368 and it will be noted that the increase in the northern States mentioned was 56 per cent. of the total increase.

### VOTE ON CONSTITUTIONAL AMENDMENTS, 1922.

New York State voters (1922) rejected the proposed Constitutional amendment, designed to increase the salaries of the Judges of the Court of Appeals, by 891,980 and 572,502.

By a vote of 819,628 to 554,654 approval was given to the amendment relating to the return of city bills to the Legislature. Under the amendment Mayors of cities are required to return special city bills to the clerk of the House from which they were sent. If the Legislature is not in session, the clerk, and not the Mayor, shall immediately transmit the bills to the Governor.

Approximately 1,000,000 registered voters failed to express themselves on the proposed amendments.

The proposed amendment increasing the salaries of Court of Appeals Judges was carried in only two counties, New York and Nassau. The amendment relating to the return of city bills was defeated in twenty-five counties, thirteen of which have cities.

Governor (1922)—Pierce, Dem., 133,392; Olcott, Rep., 99,155.

Oregon voters, in 1922, adopted the initiative measure known as the Compulsory School Bill. The bill, sponsored originally by the Scottish Rite Masons, was taken up by the Ku Klux Klan as its main issue. It is said the bill will close parochial schools. The purpose of the bill was stated on the official ballot as follows:

"Requiring any parent or guardian or other person having control, charge or custody of a child over eight and under sixteen years of age, from and after Sept. 1, 1926, to send such child to a public school during the entire school year, excepting (a) children physically unable; (b) children who have completed the eighth grade; (c) children between the ages of eight and ten living more than three miles from a public school, except where transportation is furnished; (d) children taught by parent or private teacher."

## SUMMARY OF ELECTORAL VOTE SINCE 1789.

**1789.** Previous to 1804, each electo voted for two candidates for President. The one who received the largest number of votes was declared President, and the one who received the next largest number of votes was declared Vice-President. The electoral votes for the first President of the United States were: George Washington, 69; John Adams, of Massachusetts 34; John Jay, of New York, 9; R. H. Harrison, of Maryland, 6; John Rutledge, of South Carolina, 6; John Hancock, of Massachusetts, 4; George Clinton, of New York, 3; Samuel Huntington, of Connecticut, 2; John Milton, of Georgia, 2; James Armstrong, of Georgia; Benjamin Lincoln, of Massachusetts, and Edward Telfair, of Georgia, 1 vote each. Vacancies (votes not cast), 4. George Washington was chosen President and John Adams Vice-President.

**1792.** George Washington, Federalist, received 132 votes; John Adams, Federalist, 77; George Clinton, of New York, Republican, 5; Thomas Jefferson, of Virginia, Republican, 4; Aaron Burr, of New York, Republican, 1 vote. Vacancies, 3. George Washington was chosen President and John Adams Vice-President.

**1796.** John Adams, Federalist, 71; Thomas Jefferson, Republican, 68; Thomas Pinckney of South Carolina, Federalist, 59; Aaron Burr, of New York, Republican, 30; Samuel Adams, of Massachusetts Republican, 15; Oliver Elisworth, of Connecticut, Independent, 11; George Clinton, of New York, Republican, 7; John Jay, of New York, Federalist, 5; James Iredell, of North Carolina, Federalist, 3; George Washington, of Virginia; John Henry, of Maryland, and S. Johnson, of North Carolina, all Federalists, 2 votes each; Charles Cotesworth Pinckney, of South Carolina, Federalist, 1 vote. John Adams was chosen President and Thomas Jefferson Vice-President.

**1800.** Thomas Jefferson, Republican, 73: Aaron Burr, Republican, 73; John Adams, Federalist, 65; Charles C. Pinckney, Federalist, 64: John Jay, Federalist, 1 vote. There being a tie vote for Jefferson and Burr, the choice devolved upon the House of Representatives. Jefferson received the votes of ten States, which, being the larges vote cast for a candidate, elected him President. Burr received the votes of four States, which, being the next largest vote, elected him Vice-President. There were 2 blank votes.

**1804.** The Constitution of the United States having been amended, the electors at this election voted for a President and a Vice-President, instead of for two candidates for President. The result was as follows: For President, Thomas Jefferson, Republican, 162; Charles C. Pinckney, Federalist, 14. For Vice-President, George Clinton, Republican, 162; Rufus King, of New York, Federalist, 14. Jefferson was chosen President and Clinton Vice-President.

|---|---|---|---|---|---|---|---|
| | | Senate. | House. | Senate. | House. | | |
| 1st. | 1789–1791 | 24 | 53 | 2 | 12 | Washington. | In Colonial and Revolutionary Days the Americans were either Whigs (Liberals), or Tories (Conservatives). John Adams called it a division between the Court party and the Country party. There was, however, no party organization, and the Colonists were mostly Whigs. The rulers sent from England were the Tories. In the Revolution, the people were divided between Patriots (Whigs), and Loyalists (Tories). Immediately after the Revolution, the people became either Nationalists (Republicans), or Federalists, according as they favored States' rights, or a strongly centralized government. The Federalists were stronger in the big States, such as Va., Pa., and Mass. The Republicans also were called Democrats, or Democratic-Republicans. |

|---|---|---|---|---|---|---|---|
| | | Senate. | House. | Senate. | House. | | |
| 21st. | 1829–1831 | 38 | 142 | 10 | 71 | Jackson. | The Whig party at first included National Republicans, Nullifiers, Anti-Masons, and Federalists. It finally went to pieces, as a party, on the slavery issue, and its last Presidential candidate was Gen. Scott, in 1852, who carried but four States —Mass., Vt., Ky., and Tenn. The Democratic party gradually absorbed the various pro-Slavery and States' rights elements. In the 25th Congress there were 5 Independents in the Senate and 13 in the House; in the 26th, 2 in the Senate and 6 in the House; in the 30th, 4 in the House. In the 29th Congress there were 6 Native Americans in the House as Independents. |

### NOTES ON THE ABOVE TABLE.

Since the taking of the Census of 1920 there have been several efforts in the House of Representatives to legislate toward an increase in membership, based on the growth of population. Up to the end of 1922 none of these efforts had succeeded. The chief objection to enlarging the House is that it would make that body too large and cumbersome.

Membership of House under census of 1850 was increased from 233 to 234 by act of July 30, 1852; membership under census of 1860 was increased from 233 to 241 by act of March 4, 1862; membership under census of 1870 was originally fixed at 283, but increased to 292 by act of May 30, 1872.

Representation such as shown in table was assigned after apportionment under censuses, as follows: (1790) Tenn.; (1800) Ohio; (1810) Ala., Del., Ind., La., Miss.; (1830) Ark., Mich.; (1840) Cal., Fla., Iowa, Texas, Wis.; (1850) Minn., Ore.; (1860) Neb., Nev.; (1870) Col.; (1880) Idaho, Mont., S. D, N. D., Wash., Wyo.; (1890) Utah; (1900) Okla.

Ariz. and N. Mex. were included in apportionment under 1910 census, in anticipation of becoming States.

Maine's apportionment of seven members under 1810 census was included in the 20 members originally assigned to Mass. but credited to Maine after it became a State, March 15, 1820.

The ratio under the Constitution was one Representative in Congress for each 30,000 of population. Thereafter, the ratios, as determined by the decennial censuses, were as follows: 1790 and 1800, one to each 33,000; 1810, one in each 35,000; 1820, one in each 40,000; 1830, one in each 47,700; 1840, one in each 70,680; 1850, one in each 93,423; 1860, one in each 127,381; 1870, one in each 131,425; 1880, one in each 151,911; 1890, one in each 173,901; 1900, one in each 194,182; 1910, one in each 211,877.

Of the thirteen Original States the present quotas are the same as under the Constitution in Connecticut, Delaware, Maryland, and Virginia. The original quotas in the other Original States were as follows: Georgia, 3; Massachusetts, 8; New Hampshire, 3; New Jersey, 4; New York, 6; North Carolina, 5; Pennsylvania, 8; Rhode Island, 1; Carolina, 5.

**Now, I will guarantee a real job to qualified Sweeney graduates. Learn the auto and tractor business. Learn a trade. Eight weeks course leads to employment. Free railway fare to Kansas City. Wonderful offer to you from world famous Million-Dollar trade school. FREE RADIO COURSE**

Young man, the only difference between a rut and the grave is that the grave is deeper. I say, get out of the rut. Do the work you like. Be independent. Learn a trade. Be a mechanic. Get into the auto business. You can earn big money. You can travel and see the world.

I have helped 50,000 men to success. This Million-Dollar trade school is the greatest success factory you ever saw. The way to learn is easy. You don't need any experience. I teach with tools not books. You learn your trade by actually doing the work.

You have a right to make a success of your life. Make a start now. I'd like to show you what thousands of men just in your position have done as a result of the Sweeney system of practical instruction. It's a shame for you to stick in a rut or work at jobs you don't really like.

Ask any Sweeney man. They are in good positions all over the country. Repairing and selling autos. Driving cars and trucks. Mechanics. Running garages, tire shops, battery shops. Welders. Handling radio supplies.

Learning is a real pleasure in the Sweeney School. World's finest equipment. Fine associates. Healthful surroundings. Entertainment after working hours. Instructors who take personal interest in you. Free radio course. Big radio broadcasting station.

I am now paying your railroad fare to Kansas City and giving a free radio course. No extras. No books. You are sure of getting a job when you graduate. I can't tell it all here, but send for my big catalog. Investigate this real opportunity.

**FREE** Simply send name to-day for my big 72-page catalog. Shows hundreds of pictures of men at work in the school. Tells all about wages, profits, opportunities in auto and tractor business. Explains step by step how you learn. Interesting letters from graduates telling how they made good. Shows how men come from all over the world to this big school. Makes you want to join the crowd. Tells everything you want to know about, including all the new radio details. Includes contract for employment. No cost, no obligation. Clip the coupon or a postcard will do. Get the catalog now—that's the first step. Don't put it off one minute. No colored students accepted.

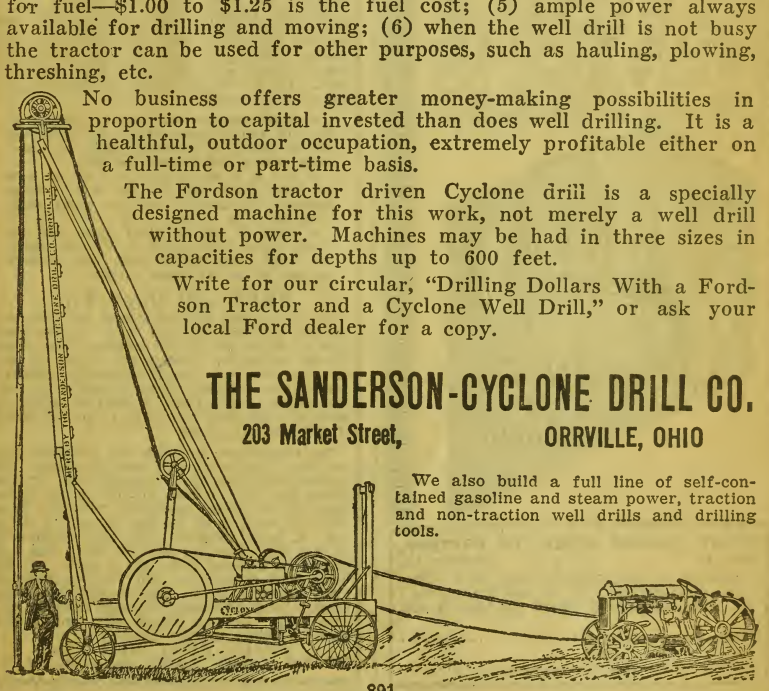
# Well Drilling With a Fordson Tractor Driven Cyclone Drill

## An Economical, Quick-Moving Outfit

THE Cyclone well drill using the versatile Fordson tractor as the power unit makes a self-propelled or traction well drill outfit of very low original cost and even lower proportionate upkeep.

Some of the advantages of such an outfit are: (1) Cost is 1-4 to 1-3 that of a self-contained traction well drill; (2) can be moved at eight to ten miles per hour (about four times the moving speed of a self-contained traction drill); (3) Fordson dealer service throughout the world available for the tractor or power unit; (4) kerosene used for fuel—$1.00 to $1.25 is the fuel cost; (5) ample power always available for drilling and moving; (6) when the well drill is not busy the tractor can be used for other purposes, such as hauling, plowing, threshing, etc.



No business offers greater money-making possibilities in proportion to capital invested than does well drilling. It is a healthful, outdoor occupation, extremely profitable either on a full-time or part-time basis.

The Fordson tractor driven Cyclone drill is a specially designed machine for this work, not merely a well drill without power. Machines may be had in three sizes in capacities for depths up to 600 feet.

Write for our circular, "Drilling Dollars With a Fordson Tractor and a Cyclone Well Drill," or ask your local Ford dealer for a copy.

## THE SANDERSON-CYCLONE DRILL CO.

**203 Market Street, ORRVILLE, OHIO**

We also build a full line of self-contained gasoline and steam power, traction and non-traction well drills and drilling tools.

# Crooked Spines Straightened!

NO matter how old you are: no matter what caused your affliction; no matter how many years you have suffered or how hopeless you believe your case to be, there is hope for you in the Philo Burt Method.

Eminent specialists who have studied and treated spinal diseases and deformities for years are first astonished, then convinced and quickly become enthusiastic upon finding one success follow another when the Philo Burt Method is used. Ask us for the names of happy patrons right in your vicinity.

**A young woman who was bed-ridden at 26 with spinal tuberculosis after suffering for 20 years, is married, happy and perfectly strong and vigorous at 29.**

**A boy of 8 was unable to walk or hold his head erect. After a few months every symptom disappeared and he walks daily three miles to school.**

**A man of 45, in cruel agony for six years, spent over $3,000 in a vain search for relief. Now works every day without the aid of any artificial support.**

## FREE—30 Days' Trial

The Philo Burt Method is new and different, not like anything you have tried. It has benefited or cured over 30,000 sufferers from spinal trouble caused by tuberculosis, Pott's disease, infantile paralysis, spinal meningitis, pleurisy, rheumatism, injuries, wrong sitting and standing postures, etc. Treat yourself at home. A 30-days' trial costs you nothing; no obligations of any kind if it fails.

The Philo Burt Appliance will positively cure any case that is curable and straighten any crooked spine that can be straightened. It gives firmer and more natural support to the spine than any torturing, unsanitary, old style brace made of steel, iron, leather, plaster of paris, etc. It is as yielding, soft and comfortable as a corset. Goes on and off like a coat and cannot be detected under the clothing. It relieves and strengthens and has accomplished many amazing cures. Let us send you sworn proof. Send no money. Simply describe your case fully. Get our liberal offer and helpful book on spinal troubles absolutely free.

# ELECTRICITY
## Needs You to Boss Jobs Like This

## Earn $3,500 to $10,000 a Year

## BE A CERTIFIED ELECTRICAL EXPERT

It's a shame for you to earn less than $100.00 a week when trained Electrical Experts are in such great demand. You ought to get more. You can get more.

Cooke Trained "Electrical Experts" earn $70 to $200 a week. Fit yourself for one of these big paying positions. Get into a line of work where there are hundreds and hundreds of opportunities for advancement and a big success.

**What's Your Future?** Today even the ordinary Electrician—the "screw driver" kind—is making money—big money. But it's the trained man—the man who knows the whys and wherefores of Electricity—the "Electrical Expert" who is picked out to "boss" ordinary Electricians—to boss the Big Jobs—the jobs that pay up to $10,000 a year.

**AGE OR LACK OF EXPERIENCE NO DRAWBACK**

You don't have to be a College Man; you don't have to be a High School graduate. My Course in Electricity is the most simple, thorough and successful in existence, and offers every man, regardless of age, education or previous experience, the chance to become, in a very short time, an "Electrical Expert," able to make from $70 to $200 a week.

**I Give You a Real Training** As Chief Engineer of the Chicago Engineering Works I know exactly the kind of training a man needs to get the best positions at the highest salaries. Hundreds of my students are now earning $3,500 to $10,000. Many are now successful ELECTRICAL CONTRACTORS.

**YOUR SATISFACTION GUARANTEED**

So sure am I that you can learn Electricity—so sure am I that after studying with me, you, too, can get into the "big money" class in electrical work, that I will guarantee under bond to return every single penny paid to me in tuition if, when you have finished my course, you are not satisfied it was the best investment you ever made.

**FREE—Electrical Working Outfit—FREE**

I give each student a Splendid Outfit of Electrical Tools, Materials and Measuring Instruments absolutely FREE. I also supply them with Drawing Outfit, examination paper, and many other things that other schools do not furnish. You do PRACTICAL work AT HOME. You start right in after the first few lessons to work at your profession in a practical way—make extra money while you learn. **GET STARTED NOW—MAIL COUPON—I want to** send you an Electrical Book and Proof Lessons, both FREE. These cost you nothing and you'll enjoy them. Make the start today for a bright future in Electricity. Send the coupon—NOW.
